GREEN MOUNTAIN.—There is considerable work going on at Green Mountain now preparatory to a systematic examination of this extensive property by Mr. MacLeod, a mining engineer interested in a rich syndicate of mining men. This is a quartz property which, with a reasonable amount of capital intelligently applied in development work, is almost sure to grow into a mammoth and valuable mining enterprise, both to the owners and the county. The tunnels already run are in command of an almost unlimited territory threaded with quartz veins, many of which, on tbe surface, were rich.

THE TABER MINE.—Napa capitalists have put up $10,000 to develop this mine near Gibsonville. By means of a tunnel already in nearly 3,000 feet, it is proposed to tap the channel in Gibsonville Ridge, part of which is now heing successfully worked by the Thistle Shaft Company, with great success. If Mr. Taber develops the channel, he and his associates will have one of the largest and best drift mines in that section.

Riverside.

GENERAL NOTES.—Work begun this week at the Briggs mine. When a depth of 350 feet is attained it is supposed that at that depth water sufficient to run the mill will be obtained.

The Alice is still in litigation.

The Santa Rosa is pushing matters with a full force of men. In the level at the bottom of the shaft the richest ore ever found in the mine is being taken out.

San Diego.

PICACHO BASIN.—Colorado men have figures from a San Francisco firm for a 100-stamp mill, and will probably arrange to have it built. The district is looking up, and attracts considerable deserved attention.

San Bernardino.

THE MCHANEY MINES.—It is difficult to get a conservative or authentic report from these new discoveries. All the statements hitherto received appear somewhat inflated. The following is a dispatch from San Bernardino:

"McHaney arrived in this city to-night direct from the mine, and brought in 100 ounces in gold slugs, and left 50 at the mine which had not yet been retorted. This 150 ounces of gold is the product of a three days' run with a two-stamp mill, in which twelve tons of ore were worked, making the run almost $200 to the ton.

"Notwithstanding the richness of the ore there is hardly a limit to the amount in sight. The ledge is located for 700 feet, and shafts have been put down thirty feet. The vein at that depth is more than four feet wide, and the ore richer than on the surface. McHaney now has twenty men at work sacking ore, which will be transported five miles to the site of the new five-stamp mill, which will be in operation in three weeks.

"McHaney talks of $1,000,000, and says he will not consider any proposition naming a lower figure. If the ore which is already in sight should average as well as that which has been milled it would not take long to run out the amount which McHaney offers to take."

A REPORTED STRIKE.—Los Angeles *Times:* Two prospectors who came into Los Angeles bring word of a good strike in the region about forty-five miles northeast of Indio, in the Gold Blossom claim, where they say Ralph Marshall and Pete Leiuhart have found a one foot ledge which assays from $400 to $600 in gold. The same authority says that Lane & Kingman in that vicinity have struck a four-foot ledge of solid galena which yields 80 ounces in silver and $20 in gold.

Shasta.

WOULDN'T BOND.—*Democrat:* One of our mine owners, who has exposed a good ledge by shaft and tunnel, was importuned a few days ago to "bond" his mine for a year, the sample ore showing up satisfactorily. The reply was: "You can select ore from the dump, or take ore from the ledge and make a working test, but if you want the mine further you will have to pay me the stated price, cash on the nail. No bonded mine for me."

EUREKA TELLURIUM.—*Democrat:* The Eureka Tellurium Mining Co.'s mill at Salt Creek, near Middle Creek station, started up Monday and will now be run continuously. Jerry Sullivan is foreman and a force of eight or ten men are at work. More will be put to work as soon as things are running smoothly. Ten stamps are dropping and the new roasting cyanide furnaces will soon be in full blast. The company have great hopes for the Tellurium mine.

THE GOLD LEAF.—The tunnel in the Gold Leaf mine, owned by W. P. Miller, is now in 350 feet and a shaft 100 feet deep will immediately be sunk on the ledge. This property is the old Hartman claim, located near the "old Frenchwoman's," on the old Shasta road. Miller's mill, on Salt creek, this side of Middle creek, has been running steadily up to Saturday last, when it was shut down for repairs. New machinery will he put in and an electric dynamo will also be put in to furnish power and lights. Frank Whipple is head operator at the mine, which is located two miles from the mill.

TO BE SOLD.—The Crown Point and Midnight mines, located in the Centerville district, are about to he sold to a Sacramento company, represented by Mr. F. L. Fowler, who is now here and has been inspecting the property. The new company intend to develop the property extensively.

"ELECTRIC SLIMERS."—Messrs. Wright & Sump are putting in new electric slimers at the Quartz Hill Mining Co.'s mill at Calumet spur—the old Calumet mill. The slimers are for saving the free gold that escapes from the mill. The plates are charged with electricity, which holds the gold to the plates and is said to work successfully.

TEN NEW STAMPS.—The Original Quartz Hill Mining Company, operating at the Calumet mill, on the river six miles above this city, are preparing to put in ten new stamps in tbeir mill. They are now dropping ten stamps steadily and are taking out exceedingly good ore. With the addition of ten more stamps the output of this mine and mill will be more than double its present capacity. Tom Foster and Frank Satterlee are doing the amalgamating at the mill.

Sierra.

TO START UP.—C. K. Harrison, W. G. Harrison, C. Helman, W. H. Armstrong, Jr., J. Rosenerantz and J. H. Cook, of San Francisco, the principal owners of the El Capitan mine, about a mile from Alleghany, are there to inspect tbe mine and make arrangements for starting up. The mine has been idle all winter, but the superintendent, W. H. Armstrong, Jr., has made a favorable report.

Siskiyou.

MINING NOTES.—*Journal:* N. Lamb is putting up a prospecting quartz mill on Yreka creek, near foot of Miner street, with capacity of five 650-pouud stamps, which will prove beneficial to quartz miners on Greenhorn creek, Humbug gulch, Yreka flats and Hawkinsville.

Wademan & Williams have a rich ledge of quartz on Greenhorn creek, which has been paying well.

The Mint quartz mine on Humbug gulch, owned by Herr and Van Nader, continues to show good prospects.

Corbyn & Co., on the north fork of Salmon river, have thirty hands at work building a new ditch and expect to have it completed for use in a short time, in supplying giants with an abundance of water to sluice down banks of auriferous clay and gravel. On the south fork of Salmon river extensive operations are in progress for developing rich placer diggings, and also on the various small tributaries and gulches, all being better supplied with water this season than for many years past.

The Eastlick brothers at Oro Fino are busily at work with their giants in piping down rich paying banks, with certainty of an extensive yield when a cleanup is made. They have plenty of water to run day and night, and have an electric light plant, which proves highly beneficial in carrying on the night work.

Songer & Dame have completed the fixing up of their machinery and apparatus for working the McConnell & Quinne river claims in the Klamath, near the mouth of Humbug creek, and are now crowding operations day and night without any intermission, by employing a large number of hands for day and night shifts. The engine used for the derricks and pumps is of 25-horse power, and lifts a steady stream of sixty inches for the sluices, in addition to working the seepage pump for keeping the claim dry, and also operating the electric light plant illuminating the claim at night.

Austin & Co., of the Greenhorn blue gravel mine, near Yreka, find the pay improving and the gold coarser as the tunneling extends westward, or up the creek. The average yield is about $1000 a week, but the prospects, with the good supply of water at present, give assurance of still better pay.

The Schroeder quartz mine at Deadwood is paying handsomely, and the enterprising owner is working a large force of hands in getting out quartz to keep the mill running steadily without intermission.

The claim of Antone Brazil & Co., near the Espey & Co. mine at Hawkinsville, has been paying handsomely of late. At the last cleanup a nugget weighing 4¼ ounces and worth $77 was taken out, also several nuggets of $10, $8, and smaller sizes, all the gold realized consisting of coarse grains.

The Spangler brothers, of Humbug creek, have a large extent of ground stripped for working, and will commence sluicing pay gravel this week, with prospects of success.

Several claims have been located between Hawkinsville and the Shasta river, in consequence of rich prospects found, and the construction of the new flume from Shasta river by Espey & Co., supplied by a 200-horse power pump raising the water over 500 feet from the river to the summit of the hill above Hawkinsville. The stockholders of the Espey Co. have also located several claims in the same locality in addition to claims purchased.

Crooker Bros. are making preparations for an extensive run at their river mine near Williams' ferry, at the old stage road crossing.

The American Bar miners, farther on down the river, are also preparing for extensive operations. This claim is owned by J. C. Bayer, of Portland, and has been a paying proposition from the start.

The Imker quartz mine, near Honolulu, owned by Chas. Imker, of Yreka, and which he has been working for several years, has gotten onto a paying basis. A five-stamp mill is in steady operation on this property.

W. H. Smith is having good success in his hydraulic mine at Henley, and is working it night and day.

Ben Reeder, who has taken out from $8000 to $10,000 with a hand mortar at his quartz ledge in the Fool's Paradise district, is getting ready to do more development work on the claim, which, as the returns show, yields some remarkably rich rock.

OPERATIONS SUSPENDED.—*Tidings:* The extensive operations that have been carried on at the Black Jack mine, near Hornbrook on the Klamath river, were closed down last Friday, for the present at least, and all but four of the thirty to thirty-five men who had been employed were discharged. This mine, which is a gravel deposit similar to the Jillson mine adjoining, was originally owned by Messrs. Cooley, Ryan and Burckhalter, and bonded by them to R. L Dunne, who had enlisted the interest of a Michigan capitalist of ample resources in the proposition. The latter had furnished the money for development, which had been carried along at a lively rate the past few months under the superintendence of Mr. Dunne. A couple of weeks ago the Michigan capitalist and his private secretary come out to look at the proposition, and their week's stay resulted in the shutting down of work. It is estimated that some $15,000 has been expended in development work, and mining men say the proposition never looked more promising. Supt. Dunne is confident that plenty of capital can easily be secured to develop such a property, and that operations will shortly be resumed on an extensive scale. Two main tunnels have been run in on the claim, No. 2 being in 300 feet, besides extensive upraises and inclines that have been made. The mine was just getting equipped splendidly for work, having had convenient buildings nicely fitted up. A small stamp mill is in good working order, fitted with first-class power. An electric light plant is on the ground, but had not been set up yet when work was suspended. Considerable of the rock had been milled and gave good returns.

Trinity.

A RICH STRIKE.—*Democrat:* The Brown Bear Mining Company of Deadwood were making preparations last fall to abandon the mine. The mine has already been practically abandoned twice. A tunnel was being run to crosscut the ledge at a depth of some 400 feet last week, and a four-foot vein of $100 ore was cut at a depth of 400 feet from the surface that mills over $100 per ton. This mine has yielded over three and one-half millions in

gold and now has as much more practically in sight.

Tuolumne.

THE UPPER BELT MINES.—The Lady Washington shows the vein coming in again prospecting well in free gold. The Draper-Whitto is being cleared out and put in shape for active work. The shaft at the Seminole Cons. is 175 feet deep; the mill is running on pay ore. The North Fork mine shows well and gives promise of good return.

THE MOTHER LODE MINES.—The Rawhide continues a steady producer from the 500 and 600-foot levels. The Gem is being steadily worked, the ore paying $7.50 a ton in the 10-stamp mill. The Alabama is idle, though the large quantity of low-grade ore would justify the erection of suitable works thereon.

NEVADA.

LINCOLN CO.

Record: Shipments of ore are being made to the Phœnix Reduction Co.'s works from the Advance mine, situated about twelve miles from Bullionville in Panaca district. A test run by the cyanide process will be made of the ore.

ARKANSAS.

The deal which has been on for some time past with the English syndicate has been closed at Little Rock. It involves the Morning Star mine, and a large tract in Marion county. The purchase price is $300,000.

COLORADO.

A LARGE CAPITALIZATION.—The Blue Bell Mining and Milling Co. have given a bond and lease on their Hobo claim to Denver parties for $50,000. It will be incorporated into a company which will be capitalized for $1,000,000.

IDAHO.

GOLD NUGGETS.—The report of the finding of a large quantity of gold nuggets by miners at work on the Sturgill bar, has been confirmed by a letter from J. A. Wright, of Sparta, who writes that a peck or more of nuggets were picked up by the men at work. Only the nuggets were taken, and as much more coarse gold is said to be lying on the bedrock, which will be taken out when a clean-up of the sluices is made.

The old channel of Snake river lies about 100 feet above the present water level of the stream. Previously miners had carried on their work on bars lying between the high and low-water mark of the river. The Sturgill bar find has caused great excitement among miners of that locality, and the old channel of the river will be prospected.

THE POORMAN.—*Avalanche:* The company operating this famous old War Eagle property has recently been re-organized, and the name changed from "The Poorman Consolidated Mines Ltd.," to "The Poorman Gold Mines Ltd." With the change in name then is also a change in management, Arthur Grothe, of Payette, being now general manager of the mines for the London stockholders, and Mr. Anderson, of Montana, the superintendent in charge. The new men have assumed control and have begun active work on the property. At present the work is confined to prospecting, sampling, surveying and re-timbering the old workings and ore bodies to find out "where they are at." The Oro tunnel will be driven ahead and connections made with the South Poorman tunnel, for the purpose of ventilation, etc., and the Belle Peck drift will be put in shape and used for the main working tunnel. The management has decided to remodel the Leonard mill, on Jordan creek, put in five more stamps, a new engine and boiler, four six-foot Frue vanners, and copper plates. The power will be sufficient to run an additional ten stamps at any time the output from the mines demand.

A wire-rope tramway will be constructed from the mines to the mill at once, which will greatly lessen the cost of transportation. Four men are now employed at the mill, tearing out the old machinery and preparing for the new.

AN IMPORTANT FEATURE.—The new tunnel which is being started to intersect the Standard vein, and which will eventually be the main working tunnel of the mine, is a feature of vast importance to this region. The mere fact of the commencement of such an expensive undertaking at a time when lead and silver are about as low in price as ever they have been known is sufficient index to the great value of the property and the high estimate placed upon it by its owners. For the next eighteen months the work will have to be continually prosecuted in order to reach the lode, which will be encountered at a distance of from 2,500 to 3,000 feet from the place of commencement. The tunnel will be about six feet wide and six feet high, the intention being to employ mules for hauling the cars. The point selected for the tunnel is not over 150 to 200 feet from the Northern Pacific railroad. A five machine-drill compressor has been ordered, and as soon as this arrives and is in place the tunnel will be driven in as rapidly as possible. It will intersect the Standard vein at a depth of 420 feet below the Banner tunnel, which is the present lowest level of the mine.

OREGON.

UNION CO.

A Union dispatch says: Messrs. Mills and Reed have just bonded their quartz-mining claim in the Bonanza basin, in the Cornucopia district, in the eastern part of the county, to Eastern capitalists, for the sum of $40,000. The purchasers will arrive in a few days and commence mining operations on an extensive scale.

UTAH.

A UTAH INCORPORATION.—*Tribune:* The Goldsmith Coal-Bank Gold and Silver Mining Company has incorporated to acquire, develop and operate mines and water rights, including coal, stone, clay lands, farms, reservoirs, canals, ditches, flumes and other real estate. The stock is divided into 1,000,000 shares, par value, $1 per share.

The incorporators have conveyed to the corporation coal lands and claims in Emery county known as the Muddy mine, the Coal-Bank mine, the Cliff mine, the Rock Canyon mine, the Dodge mine and the Stapley mine. In Millard county the Last Lad, Amy, Big Horn, Spanish, Richford, Thorne, Dodge, Big Horn No. 963, Swazy, McCornick, Yellow Bank and Busby and all the water, timber and road right locations. The directors and officers for the first are John H. Thorne, president; James M. Smith, vice-president; Ernest W. Salt, treasurer; Thomas Kune, secretary; Seth Dodge, superintendent.

The company proposes to commence development work on its mines at once.

MERCUR DISTRICT.—The plant with which the Mercur Company will hereafter refine their product is being built. The company expects to save the cost of transportation and working charges and a higher per cent of the value of the product, amounting to $4000 monthly.

SOUTH DAKOTA.

SPEARFISH CREEK.—*Pioneer:* Although there is but little excitement over the late find on Spearfish creek, there is a good body of silicious ore there which will average from $14 to $40 a ton, and a number of men are hard at work.

WASHINGTON.

HORSESHOE BASIN.—*Lake Chelan Leader:* Up to 1892 about 300 mineral claims had been located, mostly in Horseshoe Basin and near the summit of the Cascade range, where the headwaters of the Stehekin river, which flows into Lake Chelan, have their source. During 1892 prospecting and developing prospects already made were pursued with renewed energy, no less than 1000 mining men being on the ground from May to November, and during this time about 1500 mining claims were located in this region.

The general trend of these vast mineral lodes is northeasterly and southwesterly, which is about the direction of the Cascade range in this locality.

The terrific work of past glacial action in this region has so torn and carried away the sides of the mountains as to leave exposed to view extensive veins of mineral which can be readily traced by the veins themselves and unmistakable surface indications for two or three miles up and down the bare, gray and red peaks and through the intervening basins and passes. The general character of these vast ore deposits is galena, varying from 50 to 200 ounces of silver to the ton, and averaging nearly 75% in lead.

MONTE CRISTO DISTRICT.—Twenty-five men were put to work in the Mystery mine within the past few days. The concentrator has started and will treat 100 tons of ore a day. Shipments of concentrates have begun.

California Miners' Association.

Executive Committee Meeting.

An important meeting of the Executive Committee of the California Miners' Association will be held in Parlor A, Palace Hotel, San Francisco, on Thursday, June 6, 1895, at 8 P. M.

It is highly desirable that there shall be a full attendance at this meeting, and this notice is sent some weeks in advance in order that members of the Committee residing in the interior may make the necessary arrangements to be present. Representation is wanted from each county in the organization, and unless the members properly delegated attend their counties will be unrepresented. You are therefore urged to make every effort to be present, as we wish a full meeting.

The views of all the members are wanted on the "Mineral Land and Railroad" question in order to definitely determine the course to be taken by the Association in this important matter. A great deal has already been accomplished through the special committee on "Protection of Mineral Lands," but a free expression of opinion is desired as to what further steps are to be taken by the Association as a whole.

The matter of finances is also one of consequence requiring immediate attention. If the resolutions and instructions of the recent Miners' Convention are to be carried out, the Executive Committee must have funds to carry on the work. As the majority of the members of the Association reside in the interior counties, the prompt financial assistance of those counties is expected; and it is hoped that those who attend this meeting will come prepared to say what may be expected from their respective localities.

It will be noted that some of the papers of the State are agitating a renewal of the old anti-debris contest, notwithstanding the fact that there is now a Federal law regulating hydraulic mining in California, framed for the protection of all interests, and also a Federal Commission having authority under said law to permit or prevent the working of said mines, as the interests of the public require. These papers are also making an effort to bring the quartz and drift mines into the same category as hydraulic mines. All such attempts must be met by the united forces of the miners of California if they wish their industry to prosper. To this end the California Miners' Association must continue its efforts in behalf of the mining interests. All these matters will be discussed at the meeting of June 6th, and all members of the Executive Committee are urgently asked to be present.

CALIFORNIA MINERS' ASSOCIATION.
J. H. NEFF, Pres. WM. C. RALSTON, Sec'y.

Cable Address, American.
First Prize and Gold Medal Awarded by World's Fair, 1893.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.
The American Mining & Milling Machinery Co., Cleveland, O.:
GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out hubr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows less; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with less than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,
CLEVELAND IRON ORE PAINT CO

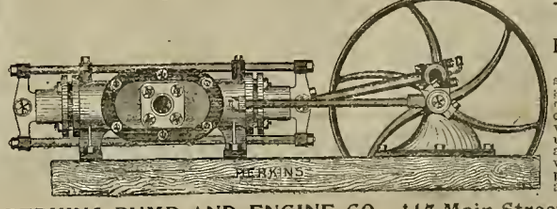
PATENT SOLICITORS.
ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.



MINERS' FAVORITE!
Perkins Double-Acting
PLUNGER PUMPS.
Capacity 2000 to 20,000 gals. per hour. Especially adapted for mines. Will raise water any height or distance and can be worked successfully under every possible situation. Pumps sand and water. No cylinder or pistons to wear out. For all particulars send to the

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XXVIII.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894, by Henry G. Hanks, F. G. S.

Humboldt County.—Natural gas occurs at Petrolia and at upper Mattole. It rises in bubbles in the bed of Mattole river. Nearly all the wells sunk for oil in early times yielded more or less gas.

While the tunnel on the line of the Eel River and Eureka railroad was being driven, escaping gas in the cuttings caused the workmen much annoyance and trouble.

"In 1868 W. H. Green and associates were sinking a well near Hydesville Suddenly an explosion took place. The well is said to have 'blown up;' the pipes were thrown out and the well ruined. Accidental ignition of natural gas was the supposed cause."

In October, 1893, I visited a flowing artesian well at the sawmill of Flanigan & Brosnan, in Eureka. It continually flows about an inch of water, which has a decided mineral taste. It is sold and largely consumed under the name of the "Humbolt mineral water." A small quantity of bubbling gas comes up with the water, which can be ignited, but it does not escape in sufficient quantity to burn continuously; generally a flash only follows the application of a lighted match. If the small side aperture through which the water flows is closed, the water in the pipe rises and overflows. This is in all respects like the Stockton gas wells to be described, except that both the flowing water and gas are less in quantity. This well was sunk about 1877, as nearly as I could ascertain.

On Bear river, at the Odell place, and at Wicks' ranch, gas escapes naturally from crevices in the earth. At Wicks' it once burned for several years. The flame burned like brandy and rose but a few inches above the ground.

I was informed by Mr. William Ayres of Eureka that near Bear river, about a mile and a half up a side gulch from the river, and four or five miles from Cape Town, there is an area of from 50 to 100 square feet over the whole surface of which gas rises and can be ignited; it once burned for four years.

Cape Town was formerly a whaling station and was called "Gas Jet," because the whalers used to try out their oil by the heat of burning gas, which they conducted beneath their kettles. Cape Town lies on the coast about three miles N. N. E. from Cape Mendocino.

Kern County.—In the report of the Buena Vista Petrolcum Company, made in 1866 by E. Benoist, after describing the oil well being sunk, he adds: "Had the requisite machinery been at hand, I should have gone to a greater depth, but deemed it to be inadmissible to do so at this time, as the quantity of gas issuing would make it difficult to prevent ignition of the oil, which circumstance in your case, when it is so abundant, would entail serious loss."

The following is an excerpt from the San Francisco *Chronicle* of unknown date: "In a well sunk for oil in Kern county, when at a depth of several hundred feet, a deposit of gas was struck. The flow was so strong that the heavy drilling tools were sent flying into the air over the top of the derrick, accompanied by a shower of stones, fragments of casing and other debris. About the well was a layer of large three-inch planking which had been used in forcing the casing into the earth. The force of the gas explosion tore a hole three feet in diameter through the three inches of solid wood, leaving the edges as sharply cut as if done with an ax." This was probably the Columbia well at Buena Vista, elsewhere referred to.

Lake County.—This county is noted for the solfataric region which lies within its borders. The sulphur bank, the great gas spring in Clear lake, the hot ammoniacal spring, the obsidian hills, sulphur fumerols and the Borax lake, are evidences of strange metamorphoses taking place below the surface. Emanations of carbonic acid, hydrosulphuric acid, sulphurous acid and hydrocarbon gases are all met with at numerous localities.

In 1878 Mr. J. S. Jamison, in a letter to the Sacramento *Bee*, described a gas-emitting mound near Kelseyville: "This mound is on the eastern boundary of the town, on a slight elevation. The mound covers one and a half acres, and gas escapes over the whole surface and can be lighted with a match, when it will continue to burn for hours and the light can be seen for a long distance at night. Several shallow wells were sunk on it by which the flow of gas was considerably augmented. A perforated tin can placed over the opening burned for several days. A pipe laid for twenty feet or more and connected with a cooking stove furnished enough gas to cook vegetables." This gas was discovered ten or twelve years before. It burned at any and all seasons of the year, but was thought to give a brighter light in the winter and spring.

Los Angeles county.—In sinking a well at Los Angeles in 1885 a flow of gas was obtained.

The following from the Los Angeles *Herald* of uncertain date probably refers to the above item, taken also from a newspaper:

"*Another Great Discovery.*—Yesterday, as Don Francisco Ruiz was digging a well on Pico street extension near the schoolhouse, on the Monte Vista road, the workman in the bottom of the well—Erasmus Durand—struck a vein of hydrogen gas that took fire from a cigarette and blazed up to a height of ten feet above the well and is still blazing. Mr. Durand was hauled out of the fiery furnace as soon as possible, but in the ascent was terribly burned in his hands, while his hair was singed off. This is a most valuable discovery for the southwestern part of the city, and should be utilized at once. The University can be lighted and heated by this well. * * * There should be a dozen wells sunk as soon as possible inside the city limits. There are now two west of the city line and many gas springs inside the city. Why are they not utilized? The cable road can propel its engine from gas that is formed beneath its track and is here and there leaking out of the rifts in the rocks to fly away into the atmosphere. All this enormous wealth should be utilized without delay. Who will open these wells of wealth and reduce the cost of fuel to one-half its present price?"

A reporter of the Los Angeles *Times* has been "doing" the San Fernando oil wells. If his statements are correct, which the *Alta* has no reason to doubt, the oil interests must be growing to an extent which is almost inconceivable. * * * He adds "that the first thing observable when darkness came on was that the city was lighted by gas, and this led to the further discovery that the cooking was done and the rooms heated and the engines run all without any other fuel than that obtained by introducing the end of an iron pipe into one of the oil wells and making connections with such places as required lighting and heating." (Excerpt from San Francisco *Alta California*.)

"Natural gas has been struck near Los Angeles. It is pouring out in large quantities under high pressure and appears to possess all the qualities necessary for heat and power purposes. The well has been bored by I. W. Hellman on his ranch, a mile or so east of Boyle Heights, formerly known as the Repette place." (Newspaper clipping, March, 1892.)

Mendocino County.—In 1873 a spring of natural gas was burning a few miles east of Round valley. From descriptions given, it resembled that of Sulphur Creek, Colusa county.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

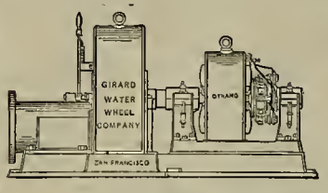
Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,
121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Girard Water Wheel Co.,
34 MAIN STREET, - - SAN FRANCISCO, CAL., U. S. A.

WATER

WHEEL

CASCADE WATER WHEEL

Adapted to all heads, from 30 FEET TO 2000 FEET. Our experience of 33 YEARS in the water wheel business enables us to suit every requirement of water power plants. Send for illustrated pamphlet. This new wheel has given an unequaled Economy in Water.

Market Reports.

The Markets.

SAN FRANCISCO, May 16, 1895.

An agreement has been arrived at with the representatives of American mines in London by which the export copper from the United States during 1895 will be restricted to a certain fixed amount, which is somewhat below the exports of 1894. At a meeting in that city last Wednesday of the representatives of the American copper producers it was decided to restrict the shipments to 60,000 tons for a year. The European producers agree to reduce the output of copper seven per cent.

The British are to coin a silver dollar for use in Hong Kong, the Straits Settlements and the far east generally, where the Mexican dollar has long been the standard coin.

It is as yet undetermined whether the China loan will be negotiated in London or Berlin. Indications favor the latter.

Local metal markets show higher quotations throughout.

Mining Share Market.

SAN FRANCISCO, May 16, 1895.

The bears set the pace and made the market during the week, and the little that was done was at low figures. The stagnation in the stock exchange is in strange contrast to the activity elsewhere.

The London *Financial News* says: "The market for mining shares grows stronger and more active every day, and the business that is now being done far exceeds anything ever before known either here or in any other stock exchange. As fast as profits are taken in one stock they are re-embarked in some other, and so the area of speculation continues to widen, and securities long neglected come into new life and prominence. The business has outgrown the capacity of the Stock Exchange machinery and the powers of endurance of the members and their clerical staffs, notwithstanding the all-day work and the frequent all-night work in the offices of the leading dealers."

The London *Standard* says: "Men have gone so mad about 'mines' that they are actually trying, in some instances, to buy the shares of companies which have been liquidated years since."

The following illustrates the changes of the week:

Assessment Notices.

OVERMAN SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 15th day of April, 1895, an assessment, No. 73, of ten cents (10c.) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, No. 414 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of May, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 11th day of June, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. D. EDWARDS, Secretary.

Office—No. 414 California street, San Francisco, California.

H. P. TAYLOR MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Liberty Mining District, Siskiyou county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1895, an assessment of Four (4c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 39 Merchants' Exchange, 431 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the thirty-first day of May, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on FRIDAY, the twenty-sixth day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HENRY SMITH, Secretary.

Office: 39 Merchants' Exchange, 431 California St., San Francisco.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of May, 1895, an assessment (No. 49) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 2d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the first (1st) day of May, 1895, an assessment (No. 41) of Fifteen (15c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 20-22 Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the first (1st) day of June, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the seventeenth (17th) day of June, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22 Nevada Block, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Gold Ridge Consolidated Mining and Milling Company will be held at the office of the Company, No. 216 Post street, San Francisco, California, on Monday, the 20th day of May, 1895, at the hour at 3 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such business as may come before the meeting.

Transfer books will close on Friday, May 17, at 1 o'clock P. M. RICHARD PHELAN, President.

Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Rock-Crushing and Grinding Apparatus, J. H. Kinkead, Virginia City, Nev. No. 538,523. Dated April 30, 1895. This invention relates to improvements in rock-crushing and grinding apparatus. It consists of a pan having a conical bottom declining outwardly from the center, sides extending upwardly at right angles with the bottom, a pan-shaped muller having a conical bottom and diverging sides, said bottom having a concavity slightly less in depth than the corresponding convexity of the bottom of the pan, the muller being entirely open on its top whereby its sides and bottom form a deep receiving chamber into which the ore to be crushed is delivered, said bottom provided with openings which are covered when the bottom of the muller forms close contact with the corresponding grinding face of the pan, and opened or exposed when the muller lifts away from said grinding face, whereby the ore is automatically fed through the openings during the gyrations of the muller, and is delivered directly to and crushed between the bottom surfaces of the pan and muller. A driving shaft extends upwardly through the center of the muller and has a crank connecting loosely with it so as to gyrate the muller about upon the bottom of the pan, and screen openings are fixed around the sides above the edge of the pan for the discharge of the material when sufficiently crushed.

Fan Attachment for Rocking Chairs.—Joel Weigel, San Francisco, Cal. No. 538,566. Dated April 30, 1895. This invention relates to that class of fan attachments for rocking chairs, in which the movement of the chair is imparted to a vertical shaft, by the rotary motion of which the fan or fans are operated. The object of the invention is to simplify the construction of this class of devices, and render their operation noiseless and generally more positive and efficient. The device consists of a shaft having a spiral end, a non-metallic nut through which said end passes whereby the engagement of the spiral shaft and nut is a noiseless one, a housing for the nut having an opening through it of greater diameter than the diameter of the shaft, whereby a rocking movement is permitted the shaft in addition to its axial movement, and a means for connecting the shaft with the back of the chair.

Apparatus for Showing Compass Deviation.—J. A. Arvidson, San Francisco, Cal. No. 538,889. Dated May 7, 1895. This invention relates to an apparatus which is designed to show the deviation of magnetic compasses and is especially applicable for the adjustment of such deviation so that the courses sailed by the ship can be accurately determined at all times when heavenly bodies are visible. It consists of a time circle journaled in standards which are supported and turnable, in conjunction with the compass suspending mechanism whereby the compass card is maintained in an essentially horizontal position; a latitude and declination circle fixed to the lower side of the ring at right angles with its journals, with an index and clamp for adjusting and holding it; a disk rotatable within the time ring having an opening made transversely across it; an observation tube journaled in the opening in the rotatable disk so as to turn transversely thereto, and an index point on the plane of movement of the observation tube adapted to coincide with the apparent time when the observation is taken.

Ore Crusher.—August H. Schierholz, San Francisco, Cal., assignor to the Risdon Iron and Locomotive Works. No. 538,884. Dated May 7, 1895. The object of this invention is to provide a means intermediate between the driving gear upon the fixed vertical shaft of an ore crusher and the table or carrier upon which the horizontal roller shafts are journaled, by which means the rollers are caused to travel upon the dies, this intermediate connection being of such a nature that it will compensate for all irregularities of movement and vertical rise and fall of the rollers as they pass over the material to be crushed without in any way conveying these motions to the driving mechanism. It consists of an annular pan with peripheral dies, rollers adapted to travel upon said dies to crush the material placed thereon, a vertical central fixed shaft with a gear-wheel loosely turnable upon the upper portion above the pan, a horizontal shaft and pinion whereby said gear is turned about the central shaft, vertical pins fixed to the hub of the gear or extension thereof, bulls through which the pins are slidable and hemispherical boxes fixed to the central horizontal table so that the pins act to rotate the table around the vertical shaft and prevent contact between the two. In conjunction with this are journal-boxes fixed to the table within which the horizontal shafts of the crushing rollers are journaled. The connection of the pins and driving mechanism is self-adjusting, and thus allows for the wear of the shoes and dies.

Gravity Valve and Vacuum Relief.—F. Cavalluro and J. N. Sturm, San Jose, Cal. No. 538,806. Dated May 7, 1895. The object of this invention is to provide a convenient and ready means for the delivery of any desired quantity of water from a stationary tank to a watering cart or other receptacle, to close the valve perfectly when the receptacle is filled and to allow the water remaining in the discharge pipe beyond the valve to escape freely and rapidly, and to allow the valve to be easily removed or replaced without emptying the tank. It consists of a valve seat with a discharge pipe leading therefrom; a conical valve fitting said seat; a tube extending up through the valve to a point above the tank to admit air into the space below the valve when the latter has been closed to prevent a discharge of water. This air allows the water remaining in the pipe below the valve to flow out rapidly. The valve seat is fitted with a flange so as to be bolted to the side or bottom of the tank, and the inside is screw-threaded to receive the corresponding threaded end of the discharge pipe, thus allowing the latter to be easily removed and replaced. The tube extending down through the valve and reaching to a point above the top of the tank is suspended by a hook or other means from a lever arm so that by pulling the cord upon the opposite end the valve may be opened, and by releasing the cord the valve may be closed. The valve has slides adapted to move on suitable vertical guides to keep it in place, and it may be easily raised entirely out of the tank, if it is desirable to do so for any purpose.

WANTED—A PARTNER

For the manufacture of the

Merralls Hydraulic Quartz Mill,

Simplest, cheapest and best Ore Mill ever invented. Will do more work than stamps. Saves more gold with less power. Wear and tear reduced to a minimum. Call or address M. A. MERRALLS, Room 12, Third Floor, Mills Building, San Francisco, Cal.

TELEPHONES!

Long Distance TELEPHONES AND SUPPLIES.

GLASS OIL CUPS

WHY do most people use the "LUNKENHEIMER" Goods, and continue to use them? Because, they have used and tested them; they have always given satisfaction, and are never misrepresented. Such being the case, do you blame them? "LUNKENHEIMER'S" "Crown" Index Glass Oil Cup with Sight Feed, is considered by all users to be the best of its kind made. Its superior advantages are so many, lack of space will not admit of their being mentioned. An impartial test however, will convince. Try them and see. Thousands of satisfied users. We also make the "Pioneer," "Victor," "Royal," "Yankee," "Ajax," "Rival," and "Ruby." All first-class and warranted. Specify and insist upon the "LUNKENHEIMER" make, and you will get the best. All goods bear our name, none genuine without. Catalogue gratis upon request.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

FOR SALE.

ONE PUMPING PLANT.

One Quadruple Force Pump; two Cornish Pumps, one Corliss Engine, 150-horse power; and five miles of 4-inch Pipe with converse lock joint. Address

611 and 613 FRONT ST., San Francisco, Cal.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charges; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1893. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I. and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humic Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salts; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

Roasting of Gold and Silver Ores (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By Guido Kustel, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

By C. H. AARON.

Aaron's Leaching Gold and Silver Ores, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

—THE—

Ore Deposits of the United States.

By J. F. KEMP, A. B., E. M., Professor of Geology, School of Mines, Columbia College.

Second Edition, Revised and Enlarged, New Illustrations.

A practical review of the ore deposits of this country. A valuable addition to up-to-date mining literature, of value to the Pacific coast. Sent postpaid upon receipt of price, $4.00. Address

Mining and Scientific Press,
220 Market Street, San Francisco, Cal.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXX. Number 21. SAN FRANCISCO, SATURDAY, MAY 25, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

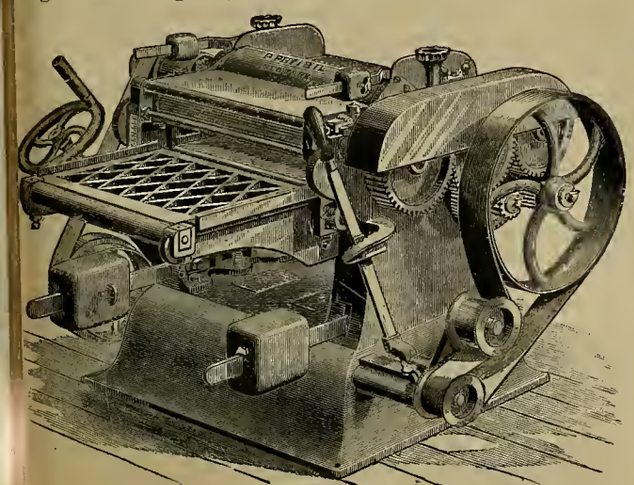
An Obvious Distinction.

The London *Mining Journal* of the 4th, in an effort at editorial rejoinder to a recent paragraph in this paper about the "Kaffir circus," completely misses the point. It would be an insult to the intelligence of that journal to assume that it failed to note that this paper's objections were not against any promulgation of South Africa's gold wealth. Hence it is fair to infer that the *Mining Journal* ignored the direct point made, which was that it was with surprise was seeu editorial endorsemeut of speculative and meretricious miuing schemes of questionable origin. Of course, if the *Mining Journal* wants to editorially endorse such schemes it has the right, but it cannot expect to do so and continue to possess the confidence or respect of its readers. It says: "We have exerted ourselves not a little on behalf of California," which certainly does go a good ways toward mollifying censure. Let us hope it will be as sternly censorious and rigidly correct in viewing Randt propositions as it is in other parts of the world.

The *Journal* cannot arouse any jealousy in California by laudations of South Africa, for there can be no rivalry; but the *Journal* well knows that honest accounts of mining operations are quite different from statements of particular properties that tend to create false ideas of value, and it knows equally as well that that is what elicited our reproof.

THE illustration below is of a 26-inch feed planer, made by P. Pryibil, which will plaue ten inches thick. The feed is double, being effected by four live rolls, which are capable of carrying a ¾-inch cut. The back rolls have self-adjusting scrapers, and all are provided with covers which, together with the shaving-guard, can be swung out of the way to give access to the knives, and to enable them to be whetted while in place.

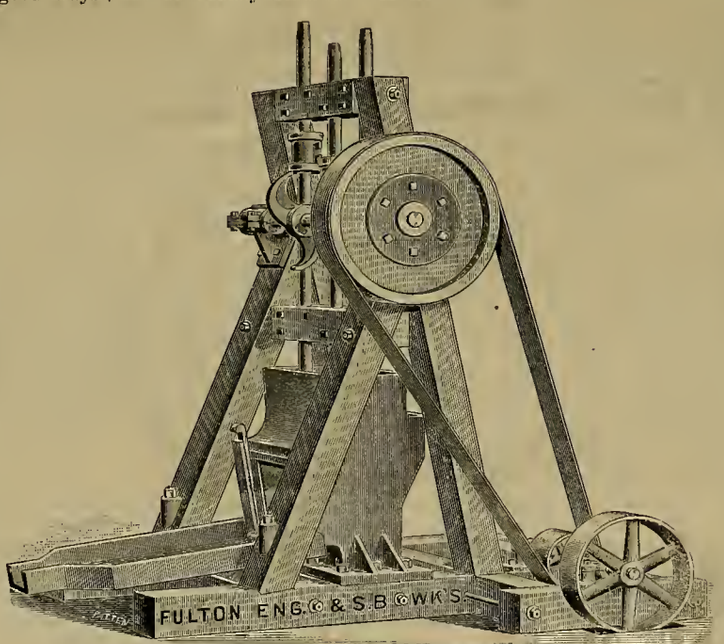
Two pressure-bars, the front one hinged and weighted, are so arranged as to hold the stock down close to the cutter-head, irrespective of the thickness of cut. Adjustment for different thicknesses of stock up to ten inches, is made by turning a single hand-wheel, each turn giving just $\frac{1}{16}$-inch variation. A scale shows at all times the thickness to which the machine is set.



TWENTY-SIX-INCH FEED PLANER.

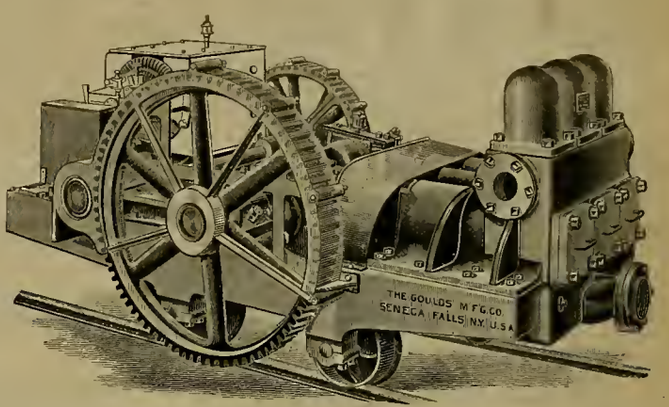
Three-Stamp Prospecting Mill.

The three-stamp mill herewith illustrated is a handy one for prospecting and where a larger and more pretentious plant cannot be readily secured. It is built by the Fulton Engineering and Ship-building Works, and is so arranged that it can be worked by horse, steam or water power. The frame can be taken apart and put together again with no cutting or refitting. The stamps are 90-drop, weigh 250 pounds each, and the entire outfit as shown, including frame, weighs 4500 pounds.



HANDY THREE-STAMP PROSPECTING MILL.

LIVING SPRINGS of white sulphur water on the old Alcalde Leavenworth estate, fourteen miles from Petaluma, recently discovered, have been analyzed and pronounced the peer of any of California's many famous mineral water outflows. An incorporated company will improve the property and establish a sanitarium.



GOULD'S HORIZONTAL TRIPLEX ELECTRIC MINE PUMP.

A New Electric Mine Pump.

The advantages of an electric mine pump are that it can be made of such form as to be easily adapted for use in shallow cuts, easily moved from place to place, can be started or stopped at a moment's notice; is economical in operation and does not require a skilled engineer to operate it. Above is giveu an illustration of Gould's horizontal triplex electric mine pump, manufactured by the Gould's M'f'g Co., a combination of a pump of the triplex pattern and an electric motor, direct geared, mounted on a truck. The pump has three plungers of phosphor bronze, outside packed, attached to the crank shaft by connecting rods at 120° apart. This method of construction permits the plungers to follow each other and overlap, giving a constant flow and securing great efficiency. The cylinders and glands are bronze-lined. The motor and pump gears are of iron, machine cut and motor pinion of bronze. The materials of which this pump is made are unaffected by mine water, and all the exposed parts are duly protected from falling debris by covers. The gears and pinions are machine-cased. The pump is of such design as to be easily adapted for working in shallow cuts.

These pumps are in operation in the William "A" Colliery of the Connell Coal Company, Scranton, Pa., Union Colliery Company, Victoria, B. C., Raybould Coal Company, Columbus, Ohio, and the Albion Iron Works, Victoria, B. C.

IN the 53rd Congress a bill was introduced requiring owners of placer claims to segregate 20-acre lots, but did not pass. There has been no change in the law regarding annual labor on placer claims, which allows a company of eight men to hold 160 acres and considers $100 worth of work sufficient, the intent in these matters being largely taken into account.

THE two most widely separated postoffices in the United States are those in Key West, Florida, and in Ounalaska, Alaska, 6271 miles apart. Two cents will carry a letter between those distant points.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gould's Horizontal Triplex Electric Mine Pump; Handy Three-Stamp Prospecting Mill; Twenty-six-inch Feed Planer, 325. The Premium Battery of 1858, for which a Gold Cup Was Given; The Model Battery of 1895, 329.

EDITORIALS.—An Obvious Distinction; Three-Stamp Prospecting Mill; A New Electric Mine Pump; Twenty-six-Inch Feed Planer; Miscellaneous, 325. Testimonial to the Battleship Oregon; Frank McLaughlin and the Valley Press: A New York Mining Man's Surprise; Production of Coal in the United States; Production of Gold and Silver in the United States; New Process on the Randt; Hydraulic Miners and the Anti-Debris Association; The Coal Combine, 326.

SCIENTIFIC PROGRESS.—Pulsations of the Earth's Crust; Preserving Telegraph Poles, 331.

MECHANICAL PROGRESS.—To Pump Coal; Keep on the Right Side, 331.

ELECTRICAL PROGRESS.—Goverument Telegraph Service; Brain Surgery for Idiots; Miscellaneous, 332.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 334-35.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 338.

MISCELLANEOUS.—Concentrates; 327. As Seen Through English Eyes: The Haycraft Process of Gold Extraction; How To Organize a Pearl Factory, 328. Silver Mines of West Kootenay, B. C.; Evolution in Quartz Milling Machinery; Curiosities of Corean Coins and Banking, 329. Books Received; Coast Industrial Notes; Effectually Answered; Personal, 330. Formosa's Unknown Interior, 336. Notices of Recent Patents, 339.

A COMMITTEE of Oregonians has made an appeal to the people of the Webfoot State to raise $10,000 to be used in the presentation to the battleship Oregon of a suitable testimonial of appreciation on the part of that commonwealth of the compliment involved in the naming of the great war vessel after that great State.

ELSEWHERE Frank McLaughlin answers one of the little squibs now appearing in the valley press. The article which elicits the Colonel's rejoinder is a simple sample of stock on hand, and nothing delights those people more than to be noticed or to have their stuff considered worth answering. Column after column of just such assertions as Colonel McLaughlin disposes of appears every week, dictated, doubtless, from headquarters, and intended solely for local consumption. The writers don't believe it themselves, but hope to revive a prejudice that is fast disappearing.

THE London *Mining World* of May 4th has an editorial interview with Robt. Williams, who is announced as intending to put into immediate operation a new process he has discovered for profitably working "millions of tons of low-grade ore" "outside the main reef" on the Randt in South Africa. From his description of his machine he seems to have in mind a California dry washer. He further says: "We are engaging, at least, two engineers from America at a cost of about 3000*l.* a year each, with their expenses. They are the finest men we can get from California. They are experts in quartz mining, and, while the object of our companies is to waste not a sixpence, we are determined to spare no money in getting the very best assistance, and the most competent advice that money can obtain, for we look upon this as economy in the long run. One of these California men will leave in about three weeks."

THE division of mining statistics and technology of the United States Geological Survey sends advance sheets of its statement regarding the production of coal in '93 and '94, the figures of which emphasize California's meager production. The smallest output of any State in '93 was that of North Carolina—17,000 tons. North Dakota is credited with 40,630 tons; Oregon, 41,683; Michigan, 45,979; California, 72,603. The figures are relatively the same for '94; the same year Pennsylvania produced 98,037,267 tons; Ohio, 13,253,646; Illinois, 8 19,949,564; West Virginia, 10,708,578. The aggregate of the nation's coal product for '93 was 182,352,774 tons, worth $208,438,696; for '95, 170,853,085 tons, worth $186,-154,604. In '94 there were 375,870 men employed in coal mining. The average price per ton ranged from 75c. in West Virginia to $3.87 in Oregon. The price per ton in this State is set down as $2.31.

SOME mouths ago, with well-meant but mistaken zeal, a city contemporary opened up a discussion about hydraulic mining that had been with mutual good will accorded a much needed rest, and since then the opponents of the hydraulic miners have at considerable length iterated and reiterated a great deal that was long ago shown to be baseless; have rehashed many old charges and made a good many statements that have no foundation either in fact or intent. The result is that the harmonious relations existing since the conference at the California Miners' Association meeting in '92 are strained, and considerable undeserved hostility is manifest. It has always been the province and the purpose of this journal to present the facts, invite discussion and conference, encourage mutual understanding, (for in this as in other cases ill-will ofttimes results from ignorance of each other) and, in general, to trust to the good sense and intelligence of all rather than deal in invective or incite harsh and unjust attack. After years of such effort and with the assistance of miner and valley resident alike, a suitable and satisfactory law was passed, competent men appointed by the federal government to administer and enforce the law, and its workings have been uniformly successful. Its provisions have been rigidly enforced, and universally complied with. Where application has been made to the United States Debris Commission for permit to build restraining works and operate by hydraulic mine, immediate and competent examination has been made, notice has been given, advocates and opponents of that particular location afforded opportunity to make statement, and without favor the requested permit has been granted or denied accordiug to the judgment of the Commission, which in no case is to be questioned. No miner has disputed the decisions of the Commission, though the anti-debris people constantly decry their work and impugn their motives, eagerly seeking the most trivial pretext in an attempt to soil what they omit to shiver. At a meeting of the Anti-Debris Association in Sacramento last Wednesday, it was stated by that society's agents that considerable illegal placer mining is going on in Plumas, Nevada and Placer counties. The report is doubtless exaggerated as similar ones have been, the idea being apparently to arouse antagonism and foment opposition rather than adhere to the truth in a statement of alleged facts, but it is probably true that in a few isolated instances in opposition to the efforts of the miners themselves, Chinese have illicitly operated sluices in ignorance or defiance of the law. It is unnecessary to say to the hydraulic miners of the State that strict compliance with the law is required of them no less as a measure of safety than as a moral principle. Every resident of any part of a region in which is located a hydraulic mine draining into the tributary of a navigable stream should constitute himself a committee of one to see that the law is rigidly observed. This has not always been done, but it should be not only a silent precept but an active duty. Especially is this necessary at this time, when everything is distorted and misstated in an effort to manufacture argument against the entire system. Any miner who violates the slightest provision of the law or neglects to comply with its every requirement is an enemy to himself and the cause he represents. It is manifestly impossible to entirely control the actions of Chinese and other irresponsible parties who take desperate chances to win a few dollars, and it is manifestly unfair to make that serve as a text to charge the miners with wholesale disposition to violate the law as has been done recently. In connection with all this, attention is directed to the called meeting of the executive committee of the California Miners' Association on the evening of Thursday, June 6. It is necessary that there be a full attendance, and every delegate is urged to be present; every county in the State should be represented. A good deal has been done by the miners for their interests, and the welfare of the entire State, but considerable remains to be done. Conference and active co-operation will be necessary. Whether justly or not, the railway corporations are credited with a present spirit of reprisal, and in revenge for the activity displayed by the miners in opposing the corporate absorption of the mineral area of the State, the subservient portion of the State press has begun fighting the mining industry, quartz, drift and hydraulic, and it is alleged with great appearance of truth, that this is the real reason for the sudden outburst of antagonism in newspaper offices in Sacramento and elsewhere. It is unfortunate that men who have temporary access to type can be thus swayed by railway influence of various kinds, but it is for the miners of the State to solidly stand up for that which is right, confident of ultimate success.

THE coal importers and dealers of this city have formed a "combine," and arbitrarily advanced the price of coal one dollar a ton. Though there is a decrease in the price of food, rent, labor, and nearly everything else, this article is advanced, apparently for no other reason than because the middlemen imagine they can do it and not be interfered with. They should be shown differently, and given a salutary lesson. The Manufacturers' and Producers' Association is now engaged in a timely effort to advance the industrial interests of the Coast. The price of coal is an important item to every consumer. In the face of this local effort to put local industries on their feet comes this greedy effort, which, if successful, must be repressive to the new movement. Since those who fancy they control the coal market evidently have no care for the principle exemplified by the Manufacturers' and Producers' Association, and are only actuated by a desire to amass wealth regardless of any one but themselves, it becomes the business duty of the Manufacturers' and Producers' Association to take such immediate action as to give those people a choice between setting the price of coal at a living figure, a fair rate, governed by the law of supply, demand, quality and quantity, or standing competition. If the last alternative becomes necessary, there is certainly brains and energy enough in the association to mine, ship and distribute the coal itself. The fact that the trust has graciously exempted "steam coal" from the sphere of its exactions cuts only an indirect figure. The principle is the same, and the concession is but a covert menace. Those people have gone too far and should be taught a lesson. There is no organization better fitted to do this than the Manufacturers' and Producers' Association, and the opportunity exists.

DIRECTOR OF THE MINT PRESTON last Wednesday issued an estimate of the production of gold by the mines of the United States approximately during the calendar year 1894, which he considers to have been 1,910,800 fine ounces, of the coinage value of $39,500,000, which is $2,500,000 less than the recent estimate of J. J. Valentine, of Wells-Fargo Express Company. The production of silver is estimated at 49,500,000 ounces, of the coinage value of $64,000,000. In the production of gold this State leads, with an output of $13,570,000; Colorado second, $9,491,000; Montana third, $3,651,000. Colorado leads in silver output, with, in Director Preston's estimate, 23,281,400 fine ounces, of the value of $30,101,200; Montana second, with 12,820,000 fine ounces; Utah next, with a production of 5,892,000, and Idaho, with 3,249,500. The revised figures place the world's gold yield for the year at $170,000,000.

A NEW YORK MINING MAN who is making his first visit to California expresses his surprise to the writer that San Francisco capitalists do not take more active interest in the development of California's gold mining industry. He says that nothing but personal inspection can convince any one of the enormous mineral wealth of this State, and that to California rightfully belongs the honor and profit of producing and acquiring it. San Francisco is doing a good deal in that direction, but is not at all hoggish, and is perfectly willing to see enterprising men from other States occupy and enjoy the good things with which Nature has endowed this favored commonwealth. There is enough for all.

Concentrates.

PLACER COUNTY has sent $1300 to the California State Miners' Association this year so far.

THE directors of the Jamison mine, Plumas Co., have about decided to build a mill on their property.

P. CLARK, manager of the Poorman mine at Burke, Idaho, says the mine will be worked out and shut down.

THE Hailey, Idaho, *Times* thinks that Camas No. 2 gold property will yield a net profit of $160,000 this year.

THE Phœnix mine, near Sierra City, is having its electric plant rejuvenated preparatory to beginning active work.

PATENTS to forty-three mining claims in different parts of Utah lie in the dusty archives of the Salt Lake land office.

THE $30,000 plant, including the mill of the Stewart mine, at Bingham, Utah, was totally destroyed by fire one night last week.

CHARLES WARD, a prominent mining man who was shot at Jerome, Arizona, by J. Brown last Saturday, died the following day.

THE Plumas *National-Bulletin* reports that forty men are employed at the Eureka mine and fifteen stamps are constantly crushing ore.

THE little quartz mill at the Black Jack mine, near Hornbrook, Cal., was burned last Wednesday. It will probably be replaced by a larger one.

ACCORDING to the Nevada *Transcript* $300,000,000 have been taken from the mines of Nevada county. For Sierra the Downieville *Messenger* claims $186,000,000.

JOSEPH HUGHES, representing Denver parties, is at Green River, Wyoming, fully equipped with pumps and machinery to thoroughly test the Green river placers.

THE Good Hope Mining and Milling Company has incorporated at Spokane, Wash.; capital stock $500,000; purpose, to operate the Good Hope mineral claim, Trail creek, B. C.

THE *Record* estimates that fully $150,000 is due from mines in the vicinity of Amador City to people there for wages and supplies. Probably one-half is due from the Gover mine.

WHILE working in his mining claim on Mill creek, Plumas Co., last Saturday, Moses Ewing was instantly killed by the falling of a tree which he and his partner had undermined.

THE *Record* says that the appointment of Harry A. Lee as Commissioner of Mines of Colorado has not thus far met with the approval of any one but the Governor and the appointee.

ABOUT two miles of the great Parrot ditch are completed at Gaylord, Montana. They have twenty-six miles in all to build, and a great part of it is to be done in heavy rock work and flumes.

THE Red Oak drift mine, near Saddle Back, northern Sierra county, is reported looking very promising, and present developments encourage the belief that it will soon be on a dividend-paying basis.

A NEW company has bought the Santiago mines, 150 miles from Durango, Mexico. They have put in a ten-stack smelter and are smelting ore yielding nine ounces of gold and an equal value of silver to the ton.

THE working force at the Bald Mountain Extension drift mine, Sierra Co., has been increased to fifty men. Nearly $60,000 has been expended in running 4000 feet of tunnel and opening out the pay lead.

THE Fremantle mine, Twenty-five Mile, Westralia, was sold in London within twenty hours of being placed under offer. Everything was done by cable, including the transmission of the purchase money.

THE nitro-glycerine house of the California Powder Works at Pinole blew up last Tuesday morning. Five white men and ten Chinese were torn to atoms and several others injured. The company's loss is about $15,000.

SACRAMENTO'S latest journalistic scare is occasioned by the filing of placer claims comprising three miles of the bed of the Sacramento river, near the Capital City, the supposition being that much fine gold is imbedded therein.

THE Australian Quartz Mining Company has incorporated at Sacramento; capital stock, $25,000. Directors—W. M. Woodward, Watsonville; E. E. Meek, Marysville; W. R. Benjamin, A. B. Ashley and J. A. Hoagland, Sacramento.

AT the Broken Hill Proprietary, Australia, for the week ending the 9th inst., 8079 tons of ore were treated, yielding 632 tons of lead containing 200,802 ozs. silver, also 1837 tons treated by amalgamating and leaching plants, producing 19,894 ozs. silver.

A COMPANY has been formed, says the Kingman *Miner*, to tunnel Stockton Hill, which, it adds, has produced more ore than all the other mines of Mojave county, Arizona. The tunnel will tap the ledges from 500 to 1000 feet below the present deepest workings.

C. G. FISK sends a photo of fifteen gold nuggets from his Ogdensburg and St. Lawrence mines, on Fall creek eleven miles from Washington, Nevada Co. The channel is seventy-five feet wide, and while the nuggets are not quite a yard wide they are extremely valuable.

THE Idaho City *World* says: "The Wells brothers made a clean-up yesterday from a run of 22½ tons of ore from their Summit mine, crushed in the South Africa mill. The ore turned out 76¼ ounces. The gold runs $14.20, which makes the clean-up $1084, or $48 per ton."

IN the State gold mines of the Ural, "artels" of "starateli," consisting of from five to ten miners, engage in mining and prospecting, and are paid by the Russian authorities in proportion to their find. "Artels" of this type sometimes find it necessary to hire outside labor.

THE Virginia, Nev., branch of the Nevada bank of this city closes its doors next Thursday by reason of dwindling business. In flush Comstock days the bank did an enormous business, the pay rolls being over half a million monthly, and the bullion handled averaging two and a half millions a month, the annual profit of the bank being nearly $1,000,000. Of later years it has shared the declining fortunes of the town, and after this month will have ceased to exist.

A YUMA, A. T., dispatch says: Eight gold mines at Picacho, on the Colorado river twenty-eight miles above there, have been sold to New York and Denver parties, who will put a mill on the property. Four of these are in the White Gold basin, and four are in the Picacho basin.

A GOOD DEAL more gold dust is being delivered at Grangeville, Idaho, this season than for several years past, the greatest portion coming from Salmon river. The water in the mountain camps has hardly started to running yet, but the yield will be fully up to the average.

THE case of mining expert Crossman, who was arrested at Carson, Nevada, on a charge of selling certain mining property he did not own, was dismissed when the defendant exhibited contracts with the mine owners showing that he was to have a half interest in case he struck gold.

GEORGE F. BECKER, of the U. S. Geological Survey, who has been investigating the gold-producing districts of the Appalachian region, reports that the entire South has produced about $45,000,000 worth of gold since 1799, $43,000,000 of which came from Georgia and the Carolinas.

JOHN BARRY, a shift boss in the Anaconda mine, Butte, Mont., was instantly killed last Sunday night by getting within reach of a blast. A few moments later James McGarvey, a miner, leaned over the shaft to call to some one below when the cage came down and struck him on the head, fatally injuring him.

ONE of the leading copper mines in the Lake Superior district reports that its yield in 1894 was 15,484,014 pounds, at a cost per pound of 5.68c. In 1864 the same mine produced 2,498,574 pounds, and the cost of mining was 26.71c a pound. The ore has changed but little in richness, and the wages of miners are a little higher.

JAMES BREEN, of Butte, Montana, for several years manager of the Parrott works, will build a smelter for treatment of the ores of Trail Creek, B. C. He has signed a contract with the others of the Le Roi mine for a supply of 37,500 tons of ore, with the option of taking an additional 37,500 tons at the same price when that contract is worked out.

E. A. ARADIE, formerly superintendent of the North Star mine, Grass Valley, sends a copy of the *South African Financial Record*, describing the Wemmer property at Johannesburg, of which he is consulting engineer. Improved management has increased the profits of the company from £2445 in September, 1894, to £13,482 in March, 1895.

NEXT to Silver Star the Nevada district attracting most present attention is Silver Peak, where a 30-stamp mill has recently been erected. There is no lumber for building, and several parties have returned to their respective camps to tear down buildings and move them in. Candelaria, Belmont, Montezuma and another place are on the list.

A SPOKANE, Wash., dispatch says: "News has reached here from Trail Creek, B. C., that a parallel vein of great richness had been discovered in the famous War Eagle mine. The Kansas City Smelting Company about a month ago offered $1,000,000 for the mine, but the majority of the stockholders wanted more. The property now is not for sale."

THOMAS CHAPMAN was found dead about 100 feet below his mining claim on Hopkins creek, near Gibsonville, Sierra Co., last week. It is not known definitely whether he was killed by a cave or blown up with a blast, as the reservoir runs constantly night and day, and had washed him down the creek below the claim. His body was terribly mangled.

THE United States voting precinct having the highest altitude is that of North Star, located near the celebrated North Star mine on King Solomon mountain, in San Juan county, Colorado. The stone at the office door of the usual voting place is 13,101 feet above the level of the sea. North Star, although almost inaccessible for from six to nine months each year on account of snows, generally polls from 75 to 80 votes.

THE Detroit Copper Company has stopped all work at Morenci, Arizona, both in the mines and at the reduction works. The stated cause is that with the existing price of copper, and the ores of the mines there being low grade, taken in connection with the cost of freights, it was impossible to run longer without loss. It is said that the shut-down is to try to force the Arizona and New Mexico railway to give cheap freight rates to the Detroit Company on coke and other supplies.

RECENT Colorado incorporations are: The Great Western Gold Mining Company, capital stock $300,000; headquarters at Colorado Springs; to operate in El Paso county. The Boston and Cripple Creek Mining Company, capitalized for $300,000; to operate in the Cripple Creek district. Gunnison Gold Mining and Milling Company, capital stock $100,000; to operate in Gunnison county. Electro-Magnetic Concentrating Company, capital stock $500,000; principal office at Denver.

DIRECTOR OF THE MINT PRESTON publishes his estimate of the total gold production of the United States for the year 1894 and makes the aggregate amount fall short of the production of 1893. Colorado shows considerable increase, California the greatest increase. Mr. Preston estimates the total gold production for the year at $39,500,000. Mr. Preston some time ago predicted that the production would exceed that of last year, but he now says that he was deceived by the miners throughout the country.

REFERRING to the coming collapse of the mining craze in South African gold properties, and the increased demand for American gold mines, the Boston *Transcript* says: "May it not be that what we are to see in the early future is an American gold mining speculation? Following the English leadership, is there not, for reasons similar to those operative abroad, a very promising field in the development of gold fields as inviting as that of South Africa to the foreign investor?"

THE Rocky Mountain Milling Company, Limited, capital $50,000, has incorporated, to acquire from the California Mining and Milling Company the lease of the Gregory mill site, 40 miles west of Denver, and to erect a customs concentration mill, the cost of which, it is estimated, will not exceed $25,000. It is estimated the profits will be $1,000 per month. The chairman of the company is Mr. John Peters, and, in addition to Mr. J. H. Collins, he has associated with him, as a director, Mr. C. H. Thompson.

THE total production of iron ore in this country in 1894 was 11,879,679 long tons of 2240 pounds, as compared with 11,587,629 long tons in 1893—an increase of about 2½%. Of the classes of iron ore mined the red hematite continues to be the leading variety, being 79% of the total production, brown hematite, magnetic and carbonite following in the order named, the last being only about three-fourths of one per cent of the total product. The number of blast furnaces in operation also shows an increase over 1893. The number in blast at the close of 1893 was 137; at the close of 1894, 185. In spite of the increase in production noted, the total value of the product was but $13,577,325, or $1.14 a ton, as compared with $19,265,973, or $1.66 a ton, in 1893.

ADVERTISEMENTS have lately appeared in the Butte, Montana, papers signed by the trustees and secretary of the Anaconda Mining Company, calling a meeting of the stockholders of that company at Butte for June 24th to consider the submission of a proposition to sell all the mines, mining ground, quartz mills, smelters, concentrators and reduction works belonging to the company and such other property as may be decided upon by the stockholders. The advertisements also state a reduction of the capital stock of the company to $1,000,000, or such other amount as the stockholders may decide upon, will be considered. Nobody there seems to know exactly what this means, but it is reported that the Anaconda people have an offer from a foreign syndicate for the purchase of their mines and plant, and that the June meeting is called to consider it.

NEGOTIATIONS are pending for the transfer of fifteen claims in the New York district, adjoining Vanderhilt, San Bernardino county. One-half these claims are owned by the Gladiator Mining Company and the other by R. F. and P. House. The property is situated on the line of the Nevada Southern road, at the present terminus. A shaft has been sunk 200 feet and a tunnel from 500 to 600 feet to a six-foot vein of gold and silver which assays well. The principal stockholders of the Gladiator Company are General Woodbury of Denver, I. A. Blake of New York, and D. Y. Scofield of this city. The Messrs. House own the other half of the property. The plan is to consolidate the properties. It is said the present owners have already bought ground and accepted plans for a smelter, to be erected at Needles, and that even if the sale does not go through they will proceed to develop the property on their own account.

LEADVILLE, Col., produces two classes of manganese-bearing ores—a manganiferous iron ore used to some extent in the production of spiegeleisen, and a manganiferous silver ore used as a flux in the smelting of silver-lead ores. The ores are all from the upper workings of the Leadville mines, and carry manganese in varying quantities, from 5 up to 25 per cent, and occasionally 30 to 35 per cent, with 0 to 20 ounces of silver, 0 to 4 per cent of lead, 7 to 8 per cent of silica, and 30 to 50 per cent of iron. As a rule, this class of ore carries but little silver, though some of the slags from the blast furnaces are so high in silver as to make it profitable to rework them for the recovery of the silver. No effort is made to save the manganese in the ore used in silver-lead smelting. In iron smelting the manganese enters into the composition of spiegeleisen. The ore is a manganic and ferric oxide, the iron being limonite, and the manganese probably psilomelane.

DURING the year 1894 the total number of persons employed in and about all the mines of the United Kingdom was 739,097, of whom 705,240 worked at the 3419 mines under the Coal Mines Act, and 33,857 at the 740 mines under the Metalliferous Mines Act. Compared with 1893, there is an increase of 22,232 persons at mines under the Coal Mines Act, and a decrease of 1882 persons at mines under the Metalliferous Mines Act. Of the 705,240 persons working at mines under the Coal Mines Act 569,678, or about 80 per cent, were employed below ground. Of the 135,562 surface workers 4583, or about three per cent, were females. At the mines under the Metalliferous Mines Act 20,011 persons, or about 60 per cent, worked below ground, and of the 13,846 surface workers 1092, or about eight per cent, were females. The total output of minerals at mines under the Coal Mines Act was 199,451,018 tons, of which 188,277,525 were coal, 2,164,863 fireclay, 6,814,546 ironstone, 1,986,385 oil-shale, and 207,699 sundry minerals. The amount of coal raised exceeds by 2,798,399 tons the highest output hitherto recorded, viz., that of 1891.

COL. MCLAUGHLIN, of Oroville, has wired to the English owners of the Golden Feather that they are on the eve of success. He cables: "Canal, head-dam, foot-dam, elevators, pipe line, ditch in perfect order. If all goes well, and weather favorable for operations, I hope to be able to turn the river in June." Alfred Berwick, the president of the company, says: "Last year the river was turned at the end of June, and I shall be very glad indeed if the Colonel is able to repeat the operation at the same date on this occasion, for this simple reason: that last year, when the river was turned, the whole of the difficult work of getting to the bed of the river, and fixing all the machinery in position, was still staring us in the face. The operation, under the most favorable circumstances, lasts for four months, and if it is done in that time, then we are very fortunate. Last year, as you will recollect, instead of attempting to make any efforts to recover the gold we authorized Col. McLaughlin to direct all efforts to making the machinery safe at the bottom of the river. That was done, and, in addition, preparations were also made towards clearing the river, so that directly he turns the river this year he can at once begin to sluice in pay gravels. We have been able to save the four most valuable months in the year, which should mean a very good story for the shareholders before the end of the season; for, in 1857, when the river was only turned for a short time by some energetic Californians, who managed to make a wooden flume, and to carry the whole of the water of the river for some six weeks, these hold men in that time recovered from a small section of the river, with the most inadequate appliances, an amount equal to a million dollars, and we know for certain that the sum of $700,000 was declared in dividends to the shareholders. They never had again such a successful year, or a year when the weather allowed them the opportunity to reach the gravels, and no further gold has been recovered, so that it remains for us, as soon as the river is turned, to at once commence operations, and then the Colonel will have at least four months for working in these gravels, which we know to contain the gold."

As Seen Through English Eyes.

"Recent Improvements in American Metallurgy" vas the subject of a discussion by Jas. Douglas before the London Society of Arts on the evening of the 22d ult., which is interesting to American mining men as illustrative of how our mining and metallurgical methods appear to an English mining engineer. His lecture is reported in the London *Mining Journal*.

After pointing out the distiuctiou between machinery and methods which are essential, or merely useful. in certain peculiarly conditioned localities, he vent on to say that there are two standards by which metallurgical, as well as other technical processes and practices, are to be judged—the staudard of absolute excellence and that of economical utility. The series of operations by which the minutest trace of each valuable constituent of an ore is recovered, and by which the reagents used are regenerated, represents, no doubt, the highest standard of the art of metallurgy; but, on the other hand, the process by which most money can be made out of a given ore in a given locality is awarded in practice the reward of adoption, even though it be wasteful or reprehensible from a scientific or technical point of view.

Remembering that most of the large mineral deposits of the United States are situated far from the center of population and of chemical industry, where, therefore, by-products are of little or no value, where fuel and reagents are dear, and where labor, owing to its scarcity and the great cost of living, commands higher wages than in any other section of the Union, it can readily be conceived that the simplest, even though it be not the most perfect, the speediest, and not the most thorough process, will be selected with a view to saving only the most important constituents of an ore, regardless of its subsidiary and less valuable elements. To the present day American metallurgy retains some of the traces of its early youth, especially a tendency to work ou a grand scale, and to subordinate scientific accuracy to a large output. Nevertheless there is exhibited in all the newest establishments uot only great ingenuity in arranging the machinery so as to obtain the maximum of automaticity, but a freedom from prejudice which prompts the candid examination and due estimation of novel inventions, coupled with a keen appreciation of the value of a scieutific training in the technical staff. The result is that work is done not ouly cheaply bnt well, and that even though American metallurgical establishments are not types of those completely equipped factories, where every constituent of the ore is saved, and the value of the by-products rises higher than that of the metal which is the primary object of search, they afford instructive examples of the judicious application of mechanics to metallurgy, and of the extent to which capacity serves as an auxiliary to economy.

In fact, the replacemeut of hand-labor by machinery is the most conspicuous difference between the metallurgical establishments of America and those, with a few exceptions, of the Old World. This peculiarity of American practice has been forced upon the profession by the high cost of labor as compared with the European standard in all the mining districts of the United States, and especially in those of the Rocky mountain region. For instauce, in Arizona daily wages are at present for miners 12s., for furnace feeders and tappers 12s. In Butte they are even higher, miners receiving 14s., furnace men 13s. On the Comstock 10s. is still paid to miners. Colorado from 10s. to 12s. is paid to miners, and corresponding prices to mill hands. Iu California, owing to the lower cost of living and the denser population, wages are lower than elsewhere in the west. Nevertheless, miners generally get 10s., and sometimes 12s. Such being the rate of wages in the principal centers of metal mining and metallurgy, it follows that from the initiation of the industry economy of labor has been a *sine qua non* of financial success.

With the steady decline of late years iu the price of products, with which a correspouding decline in the price of labor has nowhere taken place, the necessity of replacing manual by mechanical energy has grown more and more imperative. Therefore, not only in the ore concentration and in the gold mills, but in the furnace plants, the aim of the designer is to use to the uttermost the force of gravity, the power of water and the energy of steam and electricity in moving the material to be operated on, and to confine man's intervention as nearly as possible to the function of superintendence.

In reviewing the machinery, distinctly of American origin, Mr. Douglas described the original form of the Blake crusher, and of the large progeny of comminuting machines of which it is the parent. especially illustrating a circular form of crusher, such as the Comet and the Gates, to which for certain purposes, he would accord preference over the Blake. He also described in detail the steam stamp, which is not only used iu the concentrating works of Lake Superior, but likewise in some of the large western works, and in the East, where large quantities of iron ore have to be crushed for magnetic separation. Each stamp, as he desoribed it, is an isolated machine. The head is attached directly to the piston rod of a vertical steam cylinder, which is supported by four heavy converging pillars, resting on a solid frame, and holding in place a mortar. The steam valves are operated by eccentrics and rods which derive their motion from some terminal sources of power. While it will do a stupendous amount of work, it consumes from eight to nine tons of coal per diem, absorbs 150-horse power, and requires, in order to evolve its full efficiency, that it be supplied with no less than 7000 gallons of water per ton of ore crushed. Its capacity, working on soft rock, will run up to nearly 300 tons per stamp head when crushing coarse for concentration, or 150 tons when crushing fine for amalgamation. The only mills Mr. Douglas considers as supplying the place of stamps are the Sturtevant for dry crushing and the Huntington for wet crushing. He says, however, that it is essential to success in using the Huntington that the ore be reduced to coarse particles—say, by rollers—before entering the mill. In the Belmont mill, Telluride, Colorado, he saw four six-foot Huntington mills, fed from four sets of coarse rolls, crushing fine for amalgamation eighty tons of rock daily. The mill was driven by a fifty-horse power motor, deriving a 3000-volt current from a power plant fourteen miles distant.

As branches of mechanical metallurgy, Mr. Douglas referred to the more recent practice in gold hydraulicking, and the construction and management of free-milling gold and silver mills. He drew attention to Hendy's hydraulic elevator, which is successfully used for elevating large quantities of gravel to the level of the sluice boxes, where a sufficient head and quantity of water could be obtained. He quoted Mr. Hendy as saying that one of his elevators at the North Bloomfield Company's mine to-day is elevating 2400 cubic yards of water and gravel a height of ninety feet, using a water jet under a pressure of 520 feet. The lecturer also described and gave an illustration of a steam shovel and amalgamator, which is being applied to the excavating, screening and amalgamating of gold gravels in districts where either water is scarce or the level of the country prevents recourse to the usual hydraulic methods. He considers that the shovel can be successfully used where the gravels are not too coarse or mixed with large boulders. In that case the strain upon the machinery renders the cost of repairs heavy and the working of the machine slow. Under favorable conditions, he thinks it is possible that the claims of the company might be verified—viz., that sixty cubic yards an hour could be worked at a cost of ten cents per cubic yard. He gave statistics showing the very low figure at which free-milling gold ores are now treated in well-constructed mills. In such mills, when the power is supplied by water, and the stream of water is divided to Pelton wheels, coupled directly to the separate groups or even pieces of machinery, the absence of intermediate running gear increases not ouly the sense but the reality of automaticity, aud makes the skillfully arranged and thoroughly equipped California gold mill one of the triumphs of modern mechanical metallurgy. As an instance of the subdivision of water to separate parts of the machinery, he gives that of the North Star mine, in Nevada county, California, where, at the hoisting works, under a 237-foot head, an eight-foot Pelton wheel works the pump, and a six-foot Dodd wheel works the hoist. The Dodd wheel is fitted with treble-nozzle distributors, which arrangement permits of the shutting-off of the water as the car ascends the incline. At the mill, under a 227-foot head, a six-foot Pelton runs forty stamps with ninety miners' inches of water; a three-foot Pelton runs sixteen vanners with eight miners' inches; a four-foot Pelton runs the rock-breaker with twenty miners' inches; and a three-foot Pelton, supplied with water which has already been used at the hoisting works, runs a dynamo for lighting and other purposes.

Referring to free silver milling, Mr. Douglas pointed out the lack of thorough scientific investigation of the reactions involved in the Washoe process, and this he was inclined to attribute to the fact that mining and milling have been disassociated on the Comstock lode, and the milling has been controlled and practiced by companies whose aim is certainly not to give publicity to their operations. He compared the results, so far as known, of silver extraction in the Washoe mill and in the patio establishments in Mexico, showing that, so far as excellence and thoroughness go, Mexican work excels the American milling work, but that the extreme slowness of the patio process is an insuperable objection to its adoption.

The lecturer concluded by saying that the above examples are a confirmation of the thesis that speed and perfection in metallurgy do not always go haud in hand. but that it is none the less true that ouly by the aid of machinery and the handling of quantity with celerity can the demands of modern trade be supplied and lean ores be treated. The aim, therefore, of the modern metallurgist must be to attain speed without sacrificing accuracy, and to that goal we are fast approaching.

A lecture was given on the 29th ult., which was devoted to a description of the many forms of mechanical calciners in use in the United States, and to the chlorination of gold aud silver ores.

The Haycraft Process of Gold Extraction.

A public test of Haycraft's patent gold-extracting process recently took place about two miles from Adelaide, Australia, where the plant has been erected. The crusher was desigued to pulverize auriferous veinstone without the use of water, which is considered objectionable in Haycraft's process, as being likely to wash away at least an appreciable portion of the very fine gold, and to produce slimes, which are also better done without. The crusher has hardly come up to the expectations that were formed of it, says the *Mining Standard*, but another plan is likely to be adopted. The veinstone or ore after passing through the crusher and being reduced to a very fine grade is conveyed to the upper floor, just above the level of an iron pan or cauldron, into which it is placed and where the actual gold extraction takes place. In the present plant the capacity of this pan is sufficient to contain a ton of pulverized ore. Possibly in future plants its dimensions might be increased, where larger quantities of auriferous material have to be treated. The arrangements for working ou a really extensive scale would require larger paus or several of them; in either case, however, the cost would not be very great. The pau is fixed over a furnace, as the contents have to be kept boiling for an hour while the material is being treated. Water is here mixed with the crushed stuff, making it about the consistency of thick pea soup. A vertical shaft having revolving arms attached to keep the contents of the pan constantly stirred, works in the cauldron. The arms are fitted with carbou shoes, which forms the anode through which the electric current passes through the saline liquor to the bottom of the pan, which with a dish of quicksilver in the middle forms the cathode. At another part of the upper floor a dynamo is fixed to supply a powerful current of electricity to the contents of the pan and the stirrers. At the trial the index showed it to be working with an output of over 100 amperes at an E.M.F. of five volts. A small perceutage of common salt or other chloride is added to the water; the salt being decomposed by the electric current, the sodium passes to the mercury, and the chlorine rising through the mass of pulp dissolves the fine gold it meets with, and forms a chloride of gold. As the pulp circulates in the pau this chlorine comes under the operation of the electric current and is decomposed in turn, the chlorine being liberated to seek more gold, while the gold passes to the mercury cathode, thus producing ordinary amalgam. In the meantime any coarser particles of gold that are too large to be dissolved by the chlorine gravitate to the bottom, and are also taken hold of by the mercury. After the contents of the pan had been kept for an hour at the boiling point and stirred by the revolving arms, subjected also to the electric current, they were drawn off into an iron trough, except the mercury amalgam. From this trough they were washed out into a shallow trough or "shaking table," having a horizontal longitudinal movement; its object is to recover any small quautity of mercury that may have got mixed with the pulp, and any pyrites that may be worth subsequent treatment. The water finally flows out into settling pans and can be used over again, thus economizing as much as possible what is an expensive element in countries like West Australia.

Immediately on clearing the pan of one charge, another can be put in and the process repeated until the entire parcel is finished, or it is deemed necessary to clean up. The mercury amalgam is then taken from the pan and retorted in the usual way. This small plant is capable of treating twelve tons per day. The cost of treatment, including crushing, when working continuously, is estimated at about 7s 6d per ton, and the royalty to be charged for the use of the patent is fixed at the low rate of 2s per ounce of the gold recovered. The first bulk trial resulted in saving 92% of the gold out of a total content of 2 oz. 4 dwt. 16 gr. per ton.

How To Organize a Pearl Factory.

An extraordinary treasure, illustrating the successful manner in which gems can sometimes be produced by the "strategical process," was lately shown by the Smithsonian Institution. This was a pearl, the size of a pigeon's egg, of exquisite rose color, and the receptacle containing it was the original fresh water mussel in which it had been formed. The nucleus of this wonderful stone was nothing more nor less than an oval lump of beeswax which had been placed and left for a few years between the valves of the mollusk, which had at once proceeded to coat it with the pink nacre it secreted for lining its shell. The mussel was kept iu an aquarium while engaged in its lengthy task. It belonged to a species common in American rivers, and it is suggested that the result of the experiment opens to everybody the possibility of establishiug a small pearl factory for himself, by keeping a tank full of mussels and humbugging them into making great "pink pearls" for him. But the intending experimentalist is cautioned against avarice; the nucleus must be introduced well under the mantle of the creature, and, above all it must not be too large.

Silver Mines of West Kootenay, B. C.

A paper with this caption, by E. D. Ingall, M. E., Chief of Mining Statistics, Ottawa, was recently read before the Sydney meeting of the Mining Society of Nova Scotia. The following are extracts therefrom:

Until a comparatively recent period the mineral production of the Province of British Columbia was almost entirely confined to coal and gold, the latter chiefly obtained by washing the shallow auriferous gravels distributed widely throughout the province. The discovery and working of veins yielding silver ores is of a later date.

According to Dr. Dawson, the largest deposit of galena, now known as the Blue Bell mine on the east shore of Kootenay lake, was discovered as early as 1825. And amongst the earlier discoveries of this class of ores is that in the Coast Range mountains at Hope on the Fraser river.

The galena varies in grain, from large cubes down to a fine steely fracture.

It is sometimes enriched by the presence of ruby silver and the richer silver minerals scattered through it. What is known as "carbonated" ore occurs with the galena, but this is not really carbonate of lead, as one might suppose, but is the ochreous gangue material in which the silver ore occurs disseminated in the native condition. The whole probably results from the decomposition of the gangue and of the silver-bearing galena of the vein. Other minerals are associated with the galena in places and in varying quantities. Of these zinc blende is the most prominent; iron pyrites occurring in fair quantity; other metallic ores being only occasionally present.

The pure galena in solid ribs seems to effect more particularly the narrower veins cutting the shales, whereas the big developments in calcareous strata contain generally a large proportion of zinc blende, which lessens their value.

Another class of veins show rich arsenical and antimonial silver ores in a gangue composed chiefly of quartz.

In one case a tunnel was seen on a new prospect where in its length of 75 feet it was estimated that the ground broken had yielded from 50 to 60 per cent pure galena assaying 125 ounces of silver to the ton. Or again another prospect pit was seen showing a two-foot rib of absolutely pure "steel galena" with ruby silver, the ore assaying 860 ounces of silver to the ton.

When one sees such exposures you cannot help feeling that the district has a very hopeful future before it.

There is a singular law that prevails in relation to the yield of silver by galena.

All the world over the galena found in veins cutting through shales is richer in silver than the galena found in veins cutting through limestones, and it here appears that the schistose rocks are like the limestones—less argentiferous.

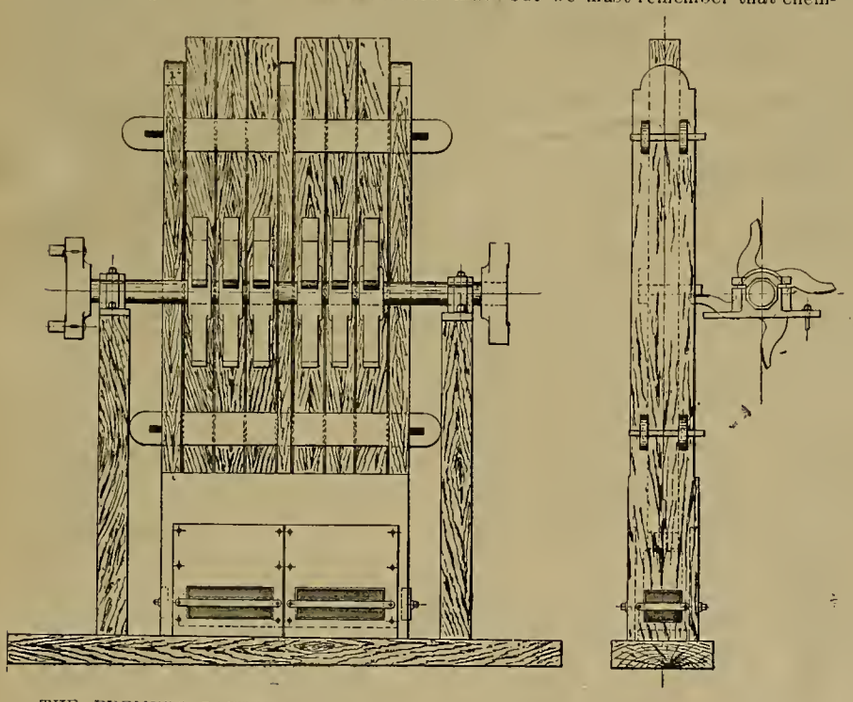
The galena from the veins in the schistose rocks seems to average lower in silver than that occurring in the shales.

GREAT DISTRESS prevails in Cornwall, says the *Mining Standard*, owing to the continued depression in the tin-mining industry, on account of the decreased American demand and the increased supplies from the Straits Settlements. The average price of tin during the present quarter has sunk lower than before. Most of the mines are working at a loss. It has been decided to close Betallack mine, which has been worked for centuries, and the fate of others is very doubtful.

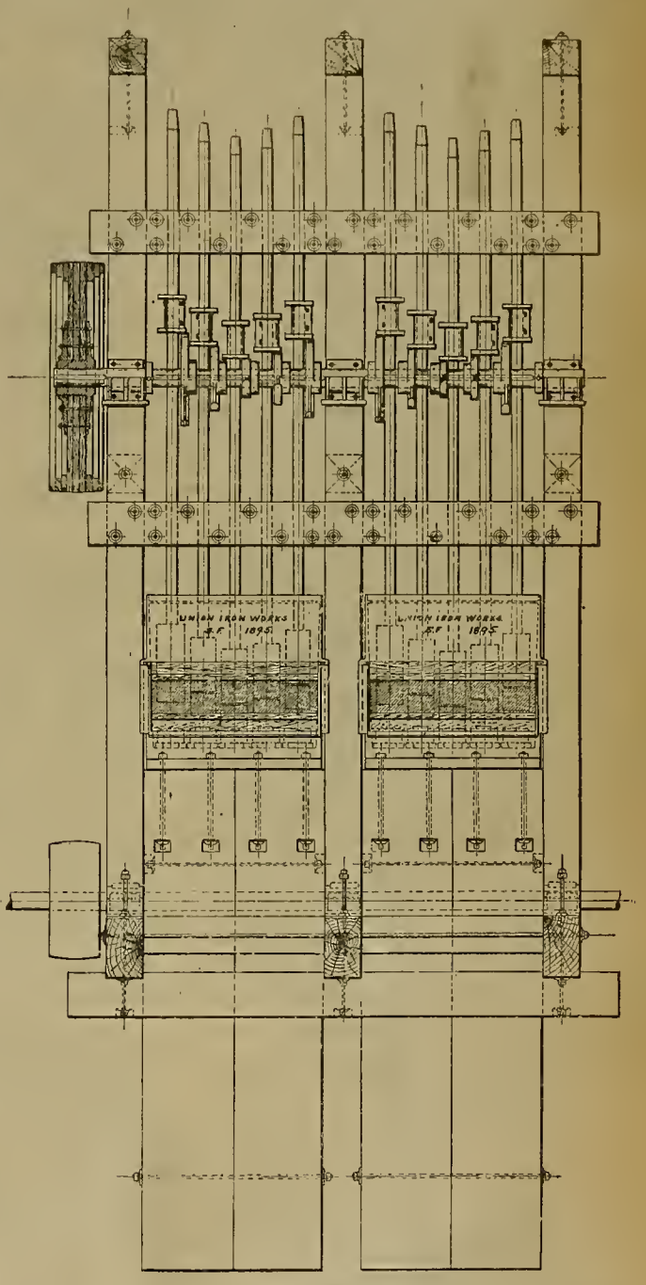
Evolution in Quartz Milling Machinery.

So much has been said and chronicled in these columns for the last thirty-five years of the progress and history of the gold stamp mill that it seems difficult now to add anything new to the complete record. Whenever a notice is given of the California stamp mill in any periodical, anywhere, the files of the MINING AND SCIENTIFIC PRESS are drawn on for data and illustration, and few factors in California's gold mining history have been more thoroughly noticed than the gold stamp mill.

As the pioneer mill of California has at this date a value by way of contrast, and showing what great strides have been made in crushing machinery, by the kindness of Mr. Melville Atwood and Mr. Almarin B. Paul we have been favored with the original drawing of the premium battery of 1858, an English mill shipped out from England for the Agua Frieo Co., and erected at Grass Valley, Nevada Co., in 1853, under the supervision of Mr. Atwood, general manager of the company, and "The Model Battery of 1895." As will be seen, there is a wide advance when we come to put this battery along side of the up-to-date battery. This paper being the permanent mining record of the coast, it will as well pass to the coming time, when the present perfected battery will be as far behind the times as it is now ahead of the pioneer mill, and the premium one of 1858. This may seem an ultra idea, but we must remember that chemistry and electricity are now playing an active part in the extraction of the precious metals, and what the coming years will bring forth only time can determine. The two cuts speak for themselves.



THE PREMIUM BATTERY OF 1858, FOR WHICH A GOLD CUP WAS GIVEN.



THE MODEL BATTERY OF 1895.

THE wire rope has been steadily making its way into new and varied forms of service since its entering the field as a competitor of its hempen predecessor. In many of these new uses it has demonstrated its special merits and superiority. The rigidity that in the earlier stages of its manufacture was a serious obstacle to its more general use, has been overcome by the progress made in the making of iron and steel, resulting in a flexibility making it easier to handle and more directly applicable where such a quality is necessary. The substitution of steel for iron has largely helped to bring about the desired results, which with new methods of grouping the wires has secured the necessary association of strength and flexibility. In the rigging equipment of ships and in hawsers used for towing purposes, the wire rope is to be found in the commercial and war marine of all nations. This in itself has developed an enormous industry that bids fair to keep itself in permanent activity, and to increase rather than diminish.

Curiosities of Corean Coins and Banking.

The funniest article of household furniture is the Corean cash box. Every man has his own bank of this kind. It is made of oak wood about two inches thick, and the lock to it weighs several pounds. The money is kept in this box, and is carried about on the backs of coolies or by servants when a man goes shopping, and in the winter it is put into the Corean safe deposits.

The Coreans have perhaps the best safe deposit system in the world, but it is one that works only during the winter. All their money is in Corean cash, which is made in coins of copper and brass, about as big as an old-fashioned red cent, with a square hole in the center. It takes six hundred coins, or three thousand cash, to make an American dollar. About twenty dollars is a good load for a man and forty dollars would break down a bullock. During the summer the Corean capitalist lends out his money for 5% and upwards a month, very judiciously placing it. In the winter, however, there is liable to be cold and famine, and it might be stolen, or his debtor might not be able to pay, so, as the cold weather approaches, he draws in his cash and puts it into his safe deposit vault until spring.

Every Corean has his own vault. It is usually his front yard, which is walled off from the street. He has his servant dig this up to a depth of about eight feet, and then the first cold frosty night he spreads out a layer of this cash in a hole and covers it with a coating of earth. He has water thrown upon this, so that the cash is imbedded in the mud, and it is watched until Jack Frost freezes it tight. The next night there is another layer of cash and a second coating of mud. This is frozen, and so it goes on until there is a solid frozen mass of cash and mud, lying two or three feet below the surface of the ground. On the top of this the ground is also frozen, and the the merchant can sleep without fear until spring.

Effectually Answered.

To the Editor :—As a sample of the injustice and mendacity of the anti-debris press, or rather of the rabid section thereof, I ask the use of your columns to call the attentiou of the miners of this State, and all other fair-minded citizens, to an item that originally appeared in the Marysville *Democrat*, and which would have passed unnoticed by me had it not been drawn from its obscurity by mention in other newspapers :

The *Democrat* is informed that large quantities of debris taken from the Banner mine is placed in the Feather river, which debris should he cared for in other ways. And the drainage of the works, which includes acids used in saviug gold, is permitted to discharge directly into the stream. The Banuer is a quartz mine located about three miles north of Oroville, and only a few yards from Feather river. Complaint is made by men who say the deposit of this matter is destroying the fishing in that vicinity.

Now, as a matter of fact, the Banner mine and mill, instead of being "only a few yards from Feather river," are located seven-eighths of a mile in an air line from the river, and such a liue would have to be projected across several intervening ridges. The mill tails into French ravine, which in turn empties into Oregon gulch, and, following the meanderings of these outlets, the nearest bank of the Feather river is one and a half miles south of the Banner mine.

I assert that not one ton of mill detritus reaches the Feather river in twenty-four hours, the gulches forming a series of natural reservoirs, and our slimes, for sampling purposes, beiug held back by a restraining dam. In milling and concentrating we use six inches of water, or rather that is the amount which leaves the mill, and of this I doubt if two inches reaches the river. Such of it, in fact, as does not seep into the ground on its journey to the river was used for many years by the former owner of the minc to irrigate a garden situated about half a mile below the mill, and his example is followed by the present occupaut.

As to "acids used iu saving gold," the charge is so ridiculous as to need no answer. As a matter of fact, I do not believe that any complaint has been made as to the killing of fish in this vicinity, or, if such assertion is made, it is for the purpose of blackmail, and is founded on arrant falsehood. The monthly product of the Banner mine adds more to the material welfare of the State than all the fishing operations on the entire Feather river, and my monthly disbursements for labor, supplies, etc., in connection with the mine is of more benefit to the community than all the fish that ever have been or will be caught in Butte county. Strange that "acids" powerful euough to kill fish when added to a volume of water equal to a flow of 2500 cubic feet per second, will, unadulterated as it comes from the mill, nourish flower gardens, strawberry and potato patches, and orange, peach, pear and fig trees as does the mill water of the Banner mine to-day.

If the Marysville *Democrat* can prove that the detritus from the Banner mine is, or has been, the cause of an increased mortality among the fish in the Feather river, or if it can prove any one of its charges against the Banner mine to be true, or founded on the slightest scintilla of justice, I will cheerfully donate $1000 to the funds of the Anti-Debris Association. Very truly yours,

FRANK McLAUGHLIN.

Oroville, Cal., May 20, 1895.

Personal.

W. C. Ralston has returned from a trip through El Dorado Co.

Col. Acg. J. Bowie is back from an extended sojourn in Utah.

Mr. Foster, of Spokane, succeeds Col. Peyton as manager of the Le Roi Mining Co., Trail Creek, B. C.

Ex-Gov. Blaisdell, who has fully recovered from his recent illness, is visiting mining property in Trinity Co.

Major W. H. Heuer, of the U. S. Debris Commission, has returned from an inspection trip through Nevada Co.

P. Geo. Gow. the local agent of the MacArthur-Forrest cyanide process, is in Sonora, Tuolumne Co.

R. Leo Van der Nailen has heeu appointed manager for the Boudreaux Dyuamo Brush Co., with headquarters at Chicago.

A. N. Butts, who sold the Golden Gate group at Mercur, Idaho, to Capt. De Lamar, is looking up some California mining property this week.

Luther Wagoner has taken charge of the McCall gravel mine at Grey Eagle Bar, El Dorado Co., recently acquired hy the Channel Bend Mining Co.

Mr. M. Bamberger, superintendent of the Golden Reward Cblorination Mill Company at Deadwood, S. D., says that he has decided to recommend the cyanide process to his company for the reduction of one class of ores, and the Russell process for those ores that carry silver with the gold.

Professor George F. Becker, Professor William H. Dall and Geologist Purrington of the United States Geological Survey left Tacoma, Wash., last Thursday to investigate under Government auspices the gold fields in the neighborhood of Shumagin and Kodiak islands, the district about Sitka and the coal fields about Cook's inlet, Alaska.

A telegram from New York to Australia has to go nearly 20,000 miles, 15,000 of which are by submarine cable, and it is handled by fifteen operators.

The Antwerp Exposition has closed its accounts and returned a twenty per cent profit to the stockholders.

Coast Industrial Notes.

—The Krogh Manufacturing Co. are shipping centrifugal pumps to Mexico and the Sandwich Islands.

—There were 28,232,178 feet of pine, spruce and fir lumber landed here from Washington and Oregon during April.

—The Sierra Valley Railway Company has put on a large force of men and is rapidly pushing the road to Beckwith.

—W. J. Houston, of Hartford, Conn., has leased ground for the erection of a large woodenware factory in South San Francisco.

—The Golden State and Miners' Iron Works is putting a 100 H. P. Harding gasoline engine in the new schooner Monterey.

—There is a scheme on foot in British Columbia to build more paper and wood-pulp mills to supply the Australian market, which must always import its paper.

—F. M. and E. A. Greenwood, of this city, with A. B. Ford, C. E. Knapp and P. M. Roedel, of San Mateo, have incorporated the San Mateo Electric Light Co.; capital stock, $25,000.

—South American houses are developing a new scheme for the organization of an intercontinental express company, hy which it will he possihle to export merchandise to Central and South America.

—A cut of from five to fifteen per cent in the wages of N. P. R. R. employes is considered in Washington and Montana—good evidence that J. J. Hill, of the Great Northern, has control in N. P. R. R. affairs.

—The S. F. and S. J. V. R. R. directors last Tuesday ordered three 65-ton freight engines to cost $10,000 each and 800,000 tie-plates. The preliminary surveys hetween here and Stockton are nearly completed.

—The Consolidated Electric Railway and Light Company of Vancouver, B. C., proposes to erect a water-power plant on Seymour creek and operate the Vancouver City electric railways and the lighting of the two cities by that means.

—The Paraffine Paint Co., 116 Battery street, this city, and 221 S. Broadway, Los Angeles, are supplying New Mexico and Alaska with their P. and B. paint, roofing and sheathing paper, illustrating their evident value in the demand from regions of such wide difference in humidity of climate.

—The Electrical Engineering Company, 34 Main St., this week installed a 25 H. P. dynamo to run the elevator in the Golden Gate building, and are completing a 50 H. P. dynamo for the Government in connection with the new guns at Fort Point. They have also this week installed a 12 H. P. motor in the San Francisco stove works.

—Information has heen received from the Treasury Department in relation to the proposed construction of a revenue cutter for service on the Pacific coast. The plans are not fully completed, but the vessel is to he huilt on this coast and will cost ahout $250,000. She will he the largest and finest equipped cutter in the Government service. Carrying ninety men and armed with two or three modern repeating cannon, she will greatly resemhle a small-sized naval cruiser.

—The Union Pacific R'y is said to have completed preliminary arrangements to reach this city: the idea is to build from Portland, Or., down the coast to Covelo. The San Francisco and North Pacific R'y is to he extended from Ukiah to that point, and a junction made with the Union Pacific, the bay terminal to he at Tihuron. The proposition involves considerahle expense and engineering problems of more than ordinary magnitude. The company's officers disclaim any knowledge of the matter and say the ahove is all news to them.

—The heavy purchases made in Washington hy the largest car huilders in the United States, the Tacoma *Lumberman* considers a most significant pointer. Wells, French & Co. of Chicago were induced to huild one car from Washington lumher. They did so, and, after its completion, put it on the scales. It weighed 2000 pounds less than one made of yellow pine, oak and white pine. Apparently that settled the question, for large orders were immediately nlaced for stock with dealers in Washington. So urgent were these demands that a representative of the company came on to push forward the orders. This compauy is now completing 600 refrigerator cars for the Armour Company to he used in the California fruit trade. This contract is to be completed hy July 1st, and it is for these cars that our lumbermen are forwarding stock.

—With the disappearance of the old Golden City Chemical Works there has grown up instead in this city the Stauffer Chemical Co., devoted to the manufacture of acids and heavy chemicals. Their sulphuric-acid chambers are immense, containing 159,000 cuhic feet, and are huilt to meet all the requirements of the coast. Their capacity for the other acids is equally extensive. Only from such large works can acids he produced cheap enough to warrant manufacturers depending on them. The consumption of sulphuric acid, that fundamental acid from which all others start, is as good an index of the industrial condition of a country as is the consumption of iron: therefore, whatever cheapens this article, promotes manufactures. The old rates on 66 acid, which were once so high as to interfere with and check manufacturing, are now reduced to 90 cents per 100 pounds, and a still further reduction is promised on large lots. In less than two years—their time in the field—the new company has secured the hulk of the trade, supplying miners and smelters as well throughout the West. Many carloads leave the works daily, reaching the Sandwich Islands, the Orient, Alaska and British Columhia. Industries hitherto unknown to California are springing up and are flourishing under the favors of this new company. The acid works of the Stauffer Chemical Co. occupy a block of land at the foot of Ninth street, in the southern part of the city, and their works for soda, whiting, sulphur, etc., occupy a block at North Beach, corner of Bay and Dupont streets. Offices at 402 Front street.

—Consul General Geringan at Shanghai, China, has sent to the State Department a comprehensive report of trade relations with China. After prefacing the statement with a report ahout the civil government of China, the principal commercial city of the empire, the consul general argues in favorahle terms of an international standard of value. He says China is a large market for cotton goods, hut there has been a falling off from 65,859,000 yards in 1892 to 27,706,000 in 1893. There has heen a falling off in the case of Great Britain from 497,475,000 yards in 1892 to 365,405,000 in 1893. The loss as regards the United States is so great, he says, as to excite anxiety. In 1873 the mills of the Orient and Occident were competing on relatively equal terms and receiving good returns. Now, in 1894, each mill employs the same amount of lahor as it did in 1873, hut the owner of the mill in the United States pays for the labor in gold at the old rates, while the owner of the mill in Japan pays for lahor in silver at the old rate. Not only does this principle of the difference in the value of currency in which lahor is paid iu the Eastern and Western countries apply to wages, hut it applies to whatever is essential to the success of agriculture and manufacturing enterprise. "If the land acquired twenty-five years ago hy the foreigners in Shanghai was worth $25,000,000 and was now sold for what it originally cost in silver and the proceeds converted into gold the loss would he ahout $12,000,000, and hy this rule it appears the inequality in the value of silver and gold has reduced the gold value of the world's property one-half. I am not writing in favor of a gold or a silver standard, hut in favor of an equalizing adjustment hetween the two. Silver is used by one-half the world and gold by the other half, and while wages in one half are paid in a depreciated currency and in the other half by an appreciated currency, a rivalry hetween the respective products of the lahor of each is encouraged, with the advantage from the outset to the products of the lahorer paid in depreciated currency, and especially when the latter can supply his daily wants with such a currency and which he willingly receives and remains contented with. Notwithstanding the plague and the war and consequent obstructions at the ports, the total value of the foreign commerce of China in 1894 was greater than ever hefore. It amounted to 390,307,433 taels, as against 367,995,130 taels in 1893. The customs receipts were greater than in any other year except 1891."

Books Received.

The chief publication received this week is "*The Mechanical Engineers' Pocket Book:* a reference book of rules, tables, data and formulæ, for the use of engineers, mechanics and students, by Wm. Kent, A. M., M. E."

Though the author modestly disclaims all assumption of originality, and anuounces himself solely as a compiler of facts and figures, yet a higher meed of praise is due him for his admirahle work than that ordiuarily accorded the mere compiler, for the contents of the work evince so much labor, condensation, exact judgment and commou-sense method as to make it of universal value to any practical man in any department of mining, metallurgy, mechauics, or applied science. The 1000 finely printed pages furnish an immense amount of practical information so arranged as to he available and of the nature most likely to he required. Every device that creates or transmits power receives elahorate attention, the tables are unusually full, and for the first time in a work of this character (so far as the writer's ohservation goes) "Electrical Transmission" is given a prominence commensurate with its importance. It is a hook indispensahle to mechanical engineers, and kindred workers, and while in no sense any competition with Haswell or Trautwine is suggested, yet the most cursory examination of the work evinces its superiority in at least the "up-to-date" information with which it is replete.

The hook is a 12mo., handsomely bound in morocco, gilt edges, etc., and is published hy John Wiley & Sons, 53 E 10th St., New York City, to whom all orders should be addressed. The price of the book is $5, postpaid.

"*What Is Heat? A Peep Into Nature's Most Hidden Secrets.*" Frederick Hovenden, F. L. S., F. G. S., etc., London, Eng.

It is helieved that the most tremendous sentence ever written is that which opens the Book of Genesis: "In the beginuing God created the heavens and the earth." Here is included the idea of the Creator—distance, space, weight, motion, time. From the date of the writiug of that sentence, 1500 B. C., to the present, we poor ephemeral humans have heen discussing the six things referred to—their relations to each other and to us. The matters akin to those things—heat, light, electricity, gravity, etc.—which we have named, and let go at that, have received equal attention. Now and then an original thinker has issued new concepts which have attained circulatiou commensurate with the truth they contained, and as the centuries slip like grains of sand through the great hour-glass of Time, theory, hypothesis and definition innumerahle have been evolved.

The book received, with the title as above, is a singular one and will attract attentiou. It is irreverent to the physicist, unsatisfactory to the philosopher, unjust to the mathematician and puzzling to the chemist; it disturhs the hiologist, contradicts some of the leaders of modern thought, upsets several pet theories of pet scientists and seeks to put molecular energy in new relations to what is usually termed "molecular physics."

Having asked "What Is Heat?" the author devotes 350 pages, handsomely printed and emhellished with 100 illustrations, to a discussion of mathematical and physical concepts: "What is a numher?" an object, an atom, a molecule, internal energy, the kinctic theory, gravitation, centrifugal force, matter, ether, electricity, vihrations, vortices, vacuums, convection, spheroids, and kindred topics iu a way that while one caunot wholly agree with him, yet his originality and manner of argument challenges the reason and often commauds the admiration of the reader. Some of his reasoning is too circular to be sustained; for instance, in decrying the accepted basis of all mathematical formulæ, he argues that as division is inverse multiplication, hence if $4 \times 0 = 0$, then $0 \div 0 = 4$. "This result," Mr. Hovenden says, "is quite in harmony with mathematical reasoning." Mr. H. will have some difficulty in securing acceptance of this allegation. His theory of gravitation is somewhat different from that of Newton, or Mr. Stephenson of this city (who hecomes irate if humhle criticism thereof he attempted), and while admitting that each individual atom has a specific power of attractiou, he holds that different species of atoms have different intensities of attraction.

All this is prefatory to the discussion and definition of "heat," which, like electricity, he holds to he a term expressing the reactions caused hy the absorption and flow of an incompressihle ether passing into and through the atom and molecule. This ether, he claims, can, under certain conditions, be seen. Part V of the hook is devoted to an elahorate explanation of how heat can be made visible to human sight.

He negatives the concept of the physicist that heat is the motions of the particles of which matter is huilt up, inveighing against that theory, and holds that "heat" is a form of molecular reaction, "an antigravitating fuuction of ether."

The work is a most interesting one and will elicit great interest among intelligent men who love inquiry and have no idols, scientific or otherwise. It is as uusettling to scientific belief as Darwin or Lyell to religious helief, and while we can not accept its utterances as conclusive, we can at least respect the earnest desire to solve nature's secrets that characterizes the purpose of the author.

It is published hy W. B. Whittingham & Co., 91 Grace Church St., London, England. Price $3.75, postpaid.

Receipt is acknowledged from the secretary of the Geograpical Society of the Pacific of an invitation to the Sixth International Geographical Congress, which will be held in London during the coming summer, under the auspices of the Royal Geographical Society. The list of honorary officers includes all the Ambassadors to the Court of Saint James, the Dukes of Westminster, Devonshire and Argyll, and numerous others of scientific or social prominence. America is represented by President Hubbard, of the National Geographical Society, Washington; President Davidson, of the Geographical Society of the Pacific, San Francisco; and President Daly, of the American Society, New York. The sum of £15,000 sterling has been subscribed in England as an entertainment fund, and the visiting delegates will be welcomed by a reception at the Lord Mayor's, followed by a round of balls, dinners, and excursions to points of interest. The delegate from the Pacific Society was appointed last year.

Mechanical Progress.

To Pump Coal.

Some time ago it was announced that a proposition had been made to convey coal by means of a pipe line, just as petroleum has long been moved. At first the idea was regarded as a joke of some enterprising journalist, but from time to time the project came to the surface. It has since been explained that the gentleman who originated the idea is Wallace C. Andrews, of the New York Steam Heating Company. He is now pushing for the construction of an experimental line, and the matter has been brought to the attention of Pittsburg coal operators and it is proposed to build a line from the Moon Run coal fields in the district to some manufacturing establishments just outside of the Pittsburg city limits. This line would be about four miles in length, and the originator claims that it will fully demonstrate the practicability of his idea. A detailed explanation of the working of the plan is thus given by the inventor:

"I believe that I have invented an exceedingly valuable method of transporting coal from the mouth of the coal mine to the general market or place of consumption. I first grind the coal to a fine powder, and by the well known process of 'washing coal' I remove an average of fifteen to twenty per cent of worthless matter. This consists of sulphurets of iron, rock and slate, which form the ash and clinker. Having thus purified the coal, I mix it one-half coal and one-half water, and pump it (precisely as crude oil is pumped) to market and deposit it in settling ponds or basins. These are cheaply made of earth embankment, with the ordinary plow and scraper. They will store 10,000 tons per acre.

"The cost of grinding will not exceed six cents per ton at or near the mouth of the mine. I also have proposals from Germany to establish here their latest machinery for washing coal, and guarantee it in plants of 500 tons per day at three cents per ton, and in plants of 1000 tons per day at two cents per ton. This makes, say, ten cents per ton for grinding and washing at or near the mouth of the mine. They also guarantee that the coal thus purified will have but about three per cent of ash and clinker, whereas coal as now shipped from the mines and delivered to the present method of railroad and water carriage gives from ten to fifteen per cent ash and clinker, and in many cases even more than this. The cost of grinding and purifying the coal is ten cents per ton, and the coal is worth at least fifty cents per ton more to the consumer.

"I have a report of tests made in Germany in the use of fine coal, showing an increase of twenty per cent of evaporation; I have also a report of tests made in Pittsburg showing twenty per cent increase as compared with lump coal. I think my estimate of the increased value of the coal to the consumer, thus ground and purified, taking the country at large, and especially at points where coal is expensive, is a fair one at fifty cents per ton. When the dry powder of bituminous coal is blown into the firebox the atoms explode and form the next best fuel to natural gas.

"The following table is made up from actual tests showing the coal-carrying capacity of pipes in tons per twenty-four hours; pumping stations thirty to forty miles apart, according to grade (supposed to average from New York to Chicago thirty miles apart), with 200 pounds pressure per square inch:

Size of pipe—	Capacity per 24 hours.
4-inch will deliver	320 tons of coal.
6 " "	800 " "
8 " "	1,824 " "
9 " "	3,168 " "
12 " "	5,120 " "
15 " "	10,240 " "
18 " "	13,750 " "
21 " "	17,920 " "
24 " "	28,160 " "

"Where the world has been mistaken is that it supposed that this mixture would clog up the pipes. I find there is no tendency whatever to do this.

"We have found that we can not only pump a mixture of fifty per cent coal and fifty per cent water, but as high as ninety per cent coal and ten per cent water. The delusion has been that people supposed the coal to be so very much heavier than the water. The fact is that when pulverized to a fine powder, measure for measure, the coal is the lightest, because of the air it contains. When sent through the pipe line, however, and delivered into tanks or settling ponds and becoming quiescent, it settles very readily; ninety per cent will settle the first hour, and the water is ready to be drawn off the next morning."

In conclusion the inventor expresses the conviction that coal can be carried by pipe line for one-tenth the cost of carriage by railroad, that delivery into the settling ponds will be only ten per cent per ton of the usual and average cost of unloading coal, and that the delivery out of the settling ponds to the consumer will be only ten per cent of the average cost by present methods.

Scientific Progress.

Preserving Telegraph Poles.

The perfecting of the creosoting of wood process has proved a godsend to telegraph companies. Telegraph poles intended for the tropics are invariably creosoted. The timber is run into cylinders, which are then hermetically sealed with immense iron heads. Steam is then admitted into the cylinder and surrounds the timber. The temperature is raised by passing superheated steam through coils within the cylinder until the timber is heated all through at a temperature just high enough not to injure the woody fibers. The vacuum pumps are put to work and all the sap and moisture in the cylinder is exhausted, heat being still maintained in the coils to prevent the vapor from condensing and remaining in the timber. After this the oil is admitted into the cylinders while they are under vacuum, and a heavy pressure is maintained until the requisite amount of oil, which is determined by gauges and thermometers, has been forced into the timber. The oil arrests decay for an indefinite period; but to have every part of the timber saturated is expensive and unnecessary. Provided that the timber is treated by the heat and vacuum process, if the crevices and pores are sealed up with the oil to a sufficient depth, the timber is as good as if the heart has been thoroughly permeated. The woodpecker is one of the worst enemies of the telegraph pole, but the creosoted wood is entirely safe from his attacks. A large consignment of these poles has just been sent to Tampico for a telegraph line over the high mountains in Mexico. They were so black with the "dead oil of coal tar" which had been forced through them that they resembled iron in both weight and color. In Mexico wood is so rapidly destroyed by tropical birds and insects that it has been found expedient to incorporate poison with the preservative solution so as to prevent the poles from being used for roosting purposes. The wires must be of copper, which lasts longer than any other metal, and withstands better the weight of birds and monkeys, which crowd them at night. Even these, according to the superintendent of one of the leading Mexican telegraph lines, are not the greatest pests that have to be dealt with.

Pulsations of the Earth's Crust.

According to Professor John Milne the crust of the earth is in a constant state of agitation, earth movements being experienced at all times and in all lands; but they are so slight from mouth to month and year to year that they generally escape detection. In all the countries of Europe and in many of those in Asia (most notably Corea and Japan) these tiltings are so great as to be noticed.

Germany seems to be the seat of greatest European crust agitation, Japan occupying a smaller position in Asia. Of the above two countries Prof. Milne says: "In both Germany and Japan a tidelike movement too great to be produced by lunar attractions has been observed, the ground being gently lifted every twenty-four hours, and sometimes twice, and in all cases buildings, trees, etc., stand slightly inclined, like cornstalks in a gentle, steady breeze." In short, the earth is constantly breathing, so to speak, the crust making each respiration by a gentle rising and falling, similar to that of the chest in air-breathing animals. It is believed that a certain per cent of this earth crust disturbance is due to conditions similar to those which bring about earthquakes. This is especially true as far as it regards Japan, where it has been traced to the continual opening and closing of the broken strata in the main range of the mountains.

Electrical Progress.

Government Telegraph Service.

Patrick B. Delaney, a veteran telegrapher, thinks that the government could do the work now covered by the postal service, vastly better by means of the telegraph. Of course radical changes will have to take place. Mr. Delaney shows that at present it costs the telegraph companies three cents to bring a message from a customer to the office and another three cents to deliver it. As this rate is based on an average of twenty words per minute with hand transmission, and sixty words per minute with the quadruplex working, it is easy to understand that the companies cannot telegraph for less than existing rates. But hand working and great numbers of cheap wires will soon be things of the past. Automatic systems and a few big copper wires reaching out to the principal cities will have a vastly increased capacity, and will before long be employed to carry quantities of correspondence which at present we do not dream of. Mr. Delaney says: "Why should the government insist on carrying our letters by train at thirty miles an hour instead of by telegraph? Why waste twenty-four hours in covering the distance between New York and Chicago? There are about 30,000 letters exchanged between New York and Chicago daily. Assuming that they average fifty words each, all could be telegraphed over two copper wires the size of a lead pencil, and with time to spare." It has been demonstrated that with the automatic chemical method, 1000 words per minute can be recorded perfectly between New York and Chicago over a one ohm per mile wire. Messages can be perforated at the rate of twenty-five words per minute and typewriters can print from the received tape at the same speed. On this basis, letters of fifty words could be perforated, transmitted, printed and delivered through the mails at a cost of about five cents. This is what Mr. Delaney says we are coming to, if the government will only take hold of the work. It will be curious and interesting to watch the bearing of the enormous development of telephony which is close at hand, and to see what part it will play in the cheapening of telegrams, whether the government acquires control of the telegraph service of the country or not.

Brain Surgery for Idiots.

An operation has been performed in New York by means of an electrical saw, which seems to indicate a distinct advance in brain surgery. It is well known that idiocy is often caused by the premature closing of certain soft bones in the heads of children, whereby the growth of the brain is obstructed. The usual treatment is to take a piece of the skull bone from the top of the head, and thus afford the cramped brain an opportunity to expand. Heretofore, the bone has been cut out with a punch somewhat resembling a conductor's punch, but this method was so jarring to the brain that the resultant shock nearly always killed the patient. The new method, which has been successfully practiced by Dr. S. B. Powell, in nineteen cases out of twenty, is to make the usual four trephine openings into the skull, and to insert a broad strip of silver gently into one of the openings and work it along between the brain and the skull until it protrudes from the next hole, thus forming a shield between the brain and the skull, which obviates all danger of accident from the slipping of the instrument by which the portion of the skull is to be excised. A minute circular saw, operated by electricity, is then brought into use. A cut is then made from one trephined hole to the other, and a second cut is made about one-eighth of an inch from the first. The intervening bone is removed, and the brain is exposed. Two more cuts are made between the other trephined holes, the bone removed, the silver strips withdrawn, the flap of scalp drawn back and stitched, and the requisite bandages applied. Ordinarily, the operation lasts about twenty-five minutes. The great success which has attended these operations is attributed by Dr. Powell almost entirely to the great delicacy of treatment rendered possible by the electric saw. He thinks the operation has come to stay. It is not claimed that it will change idiots into persons of much mental capacity, but beyond question they can be improved so much in mind and brain that they will not be burdens to their friends and relatives, as idiots but too often are. The electric saw used weighs less than an ounce, and it can be operated as delicately as a scalpel.

THE Mutual Electric Light Co., a recent local organization, is credited with being the cause of the cut in San Francisco rates and with further intent to make a bold bid for extensive business. Its office and power station is at 617 Howard street; the officers say they have several contracts for furnishing electrical light and power and have filed bonds for the building of four miles of street conduits. They install four new boilers this week and announce an intention to make price and efficiency the test for their successful claims to public favor.

CONSTRUCTION of the Marysville and Auburn electric railway has begun. It will run from Marysville to Auburn, fifty miles, and will carry freight and passengers. Power for the road will be furnished by the South Yuba Water Company; the power house will be located near the line of the road below Grass Valley, Nevada Co.

THE churches of San Francisco are adopting the electric system of lighting, several prominent ones being handsomely decorated with electroliers. The old Paulist Cathedral on California street, which was dedicated more than forty years ago, is now being supplied with incandescent lights throughout.

THE flower fetes throughout the State, which exhibited unusual splendor, will be eclipsed at Santa Cruz this week by the Venetian water carnival, wherein thousands of incandescent and arc lights will line the water.

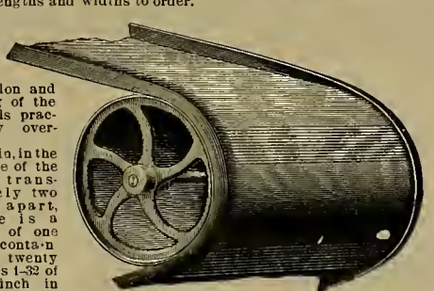
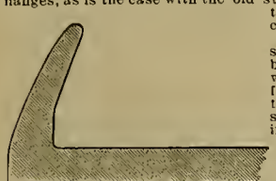
Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.





Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equallize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the taillngs from a belt with an entirely smooth surface.

H. G. BLASDEL, JR., Manager,

419 California Street, Haywards Building ..... San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Twenty stamps at the South Spring Hill mill in Amador City are running on ore from the Median mine. At the Median, the shaft is down 300 feet and drifting from this level has been progressing for some time, both north and south. The vein is strong and varies in width from five to fifteen feet and is of good mining quality.

BELLWETHER.—*Republican:* Mr. Underwood has the first option on this mine. Mr. Bright is in hopes that he will fail to come to time, as English capitalists stand ready to take it, paying $50,000 in cash, and $50 000 in stock, and will spend $200,000 in placing it on a working basis. Should the former take it he will personally superintend the operations.

MAYFLOWER.—The miners on the Mayflower and Original Amador properties have quit work on account of not receiving their pay. The wages have been running behind of late, and the men decided to quit until they received the whole or a considerable part of the sum due them.

THE ARGONAUT.—The Argonaut shaft is down 700 feet, still in slate, which is found harder to work than the adamantine greenstone previously passed through. The slate lies edgeways, and is full of seams, consequently it blasts badly. More holes have to be drilled, and the debris blown out is smaller it quantity. It was expected to tap the ledge at the present depth, but there are no indications at present of an early termination of the slate formation.

The Wildman and Mahoney mines, at Sutter Creek, both operating under the same management, have about 90 men on the payroll.

Butte.

GOLDEN QUEEN AND GOLDEN BUTTERFLY.—The Golden Queen quartz mill is reported ready to resume operations at Forbestown. The new tunnel for the Golden Butterfly mine, which has been commenced in the old Hendricks mine, is so low that a great mining district will be drained by it. If the drainage is as perfect as many experienced miners believe, the gravel and quartz mines about Oregon City and Cherokee will be greatly benefited, for they can be worked at a slight expense compared with the present expensive way of getting rid of the water.

GENERAL NOTES.—*Times:* Sixty-five men are employed on the Banner.

Work on the Golden Feather will begin early in July probably.

F. Parke and M. Hitchman of Hurleton will shortly open a placer claim on McCabe's creek.

The work on the Golden Butterfly is progressing. At present three shifts of four men each are employed, and the shaft is in about ninety feet.

The Golden Queen mill, at Forbestown, has been started up to make a mill test of about 300 tons of ore from the Honeycomb mine, which is owned by the same company as the Golden Queen. It is believed the rock will prove rich enough to warrant a continuance of the run.

The Clark Bros. & Duensing have put in a hydraulic pump on their gravel claim on the north fork above Big Bar. This pump is the first one they have found that would handle the water; and as the gravel is very rich, they expect to make a stake. In two day's run last fall they took out about $200, with seven men, but on account of too much water they could not then continue the work.

Calaveras.

THE BIRNEY MINE.—A strike is reported at the Birney mine, near Angels. While crosscutting on the 169-foot level a blind vein was encountered, and it is estimated that the rock will yield from $8 to $12 per ton. The ledge has been worked through eight feet, but neither the hanging-wall nor footwall has been discovered. It is locally reported that the mine was recently bonded for one month, and that since that time Salt Lake parties have offered $22,000 cash for the property. A representative of the Birney people is here to see the parties there who are negotiating for the mine.

El Dorado.

PARKER MINE.—*Republican:* R. S. Raw has taken charge of the Parker mine, between Grizzly Flat and Brownsville, as superintendent, and calls for bids to sink a shaft about one hundred feet deep on the property. Some New York men are interested with the present owners in the further development of the mine.

UNITY MINE.—Superintendent Kimble, at the Unity mine, has completed the changes in the machinery, which has been erected at the new incline, and the men will be put at work underground this week.

HAVILAH MINE.—The water was pumped out of the Havilah mine, at Nashville, several weeks ago, and the timbers found in remarkably good condition after their soaking of twelve years. The men are now engaged in stoping ore from the mine. The same company is operating the New London mine at Plymouth, and is having much trouble there, as the shaft was caved for 300 feet.

Kern.

AMALIE DISTRICT.—From our special correspondent: The Amalie mining district was organized April 13, 1895. It is situated in the Agua Caliente canyon, Kern county, about fourteen miles from Caliente on the S. P. R. R. Its laws outside of the U. S. laws are very simple. They require ten feet of work done prior to recording location notice, allowing sixty days in which to do the work. It also requires twenty-five days' work or an expenditure of $100 each year on every claim and an affidavit of said work or expenditure, to be filed with the district recorder.

Since the organization of the district there have been several good strikes made on which the required amount of work has been done and the notices recorded. There is probably no better field in California for the good, close, industrious prospector. There is plenty of wood and water, with as fine a formation for mineral as one could wish to see. There has been work enough done on some of the mines to establish, without a doubt, the fact of the existence of precious metals. The first of these is the Amalie, from which our district takes its name.

This mine was originally located by C. Moore, and in March, 1894, was bought by W. E. Rogers et al, and the Amalie Company was organized for its development. At the time of the purchase by this company there was but a few feet of work done, although this work showed a good lead of fair-milling rock with a streak averaging about two inches of shipping ore. In April of the same year there was a crew of men put on to develop the property. The ore was a chloride, carrying both silver and gold, about one-third of its value being in gold. They began sinking in two places on the lead. When at the depth of 100 feet they began a tunnel which connected the two shafts. Up to this time there had been no material change in the character of the ore, but the vein had gradually widened and the shipping ore had reached an average width of twelve inches. After connection was made, the tunnel was continued, following the lead for about fifty feet, when a round of holes brought a change of ledge matter, and for the next seventy feet they had an average of sixteen inches of as handsome, high-grade ruby silver ore as ever came out of the ground.

In about the center of this ruby shoot they started a winze which is now down 100 feet below the tunnel, making a total depth of 200 feet, and the ledge has grown stronger and richer with every foot in depth. On the 200-foot level the silver, in combination with the gold, is in the form of a chloride, sulphide and native wire. Every fifty feet drifts have been run from 100 to 200 feet each way from the winze and a second winze has been put down to the 150-foot level, which gives the mine a fine ventilation. So far no water has been encountered, and the company is putting in a gasoline hoist and making other necessary preparations to do some rapid sinking in the next few months. They have at present about twenty men employed and are shipping several cars per month to the smelters. They have a twenty-ton mill more than busy, and have now on the dumps about 300 tons of chloride and 400 tons of sulphide ore. This has ceased to be a prospect, and has as a mine a bright future before it. G. E. F.

Mariposa.

MACHINERY ARRIVED.—A carload of machinery arrived at Merced last week for the smelting works being erected near Hornitos by E. McGrath.

Nevada.

WASHINGTON DISTRICT.

Herald: King Bros. & Co. have obtained a lease of the Rainbow mine, in God's Country, and have commenced taking out ore.

Henry Phillips is pushing the work at the Mountain View mine and will have a mill up shortly. He will probably bring the mill in by way of Graniteville, and pack it by sections on mules from the old Star mine, which point can be reached by wagons.

Work continues as usual at the Oak Tree mine. A full force are at work and thirty stamps are kept constantly running.

The Rocky Bar mine is making better progress than heretofore, the place being better opened. Immense boulders are encountered, which necessitate a great deal of blasting.

Placer.

MOUNTAIN VIEW MINE.—*Herald:* McCullough's mill on Nortb ravine has been running the past week, crushing ore from the Mountain View mine down on the river south of Auburn. The rock pays well, averaging from $20 to $30 a ton. We understand Superindent McNaughten will erect a mill at the mine soon.

THE GRAY EAGLE MINE.—Breasting of high grade ore has begun at the Gray Eagle, and the mill has started up. In a recent report on this mine G. C. Hunter says:

"From the bottom up, for a distance of three feet, they have got splendid looking blue gravel, and I am of the opinion that this very blue gravel is the upper part of the pay ore and that it extends down and connects with the bedrock. How far the bedrock is below the level I cannot say. I find that they are in a great channel, once the bed of some ancient and mighty river. Taking as a criterion the richness of the other mines on the same divide, I do firmly believe that they have got one of the greatest and best mining properties of its kind in California. At a point several hundred feet back from breast a crosscut has been run to south rim. At this point the channel is about 125 feet wide. From the bottom of said crosscut a winze has been sunk to a depth of about six or seven feet, and no signs of bedrock in the bottom. The gravel for the whole depth would have paid, the superintendent told me, but the water was too strong and they had to quit. I have seen the rim rock on south side at several points along the tunnel, but the north rim I have only seen twice.

"It seems to me that the tunnel is near the center of the channel, as the layers or stratifications are nearly level across the breast. I very strongly recommend, and as strongly advise, that the tunnel be run ahead until they strike the bedrock, and when you have got that well in sight they can then open up the channel from rim to rim. The bedrock will then be the floor of your work, and breasting-out would next be in order. They are then prepared and in condition to work the mine intelligently, economically and to the very best advantage. There is no other way by which they can work the mine practically and in a common-sense way.

"There are many important reasons why this plan should be adopted. In the first place they can get the very best of the ore which will be found on and near the bedrock and up as high as it will pay, and by mixing all of it together you get a true general average. You will find in many places that the top of the bedrock is soft and full of cracks. There you will find the richest part of the ground and may extend from rim to rim for a depth of several inches, or until the rock gets hard underneath.

"This you mix with your gravel and all is sent to the mill together. You have got all there is of value and nothing has been either wasted or lost. Again, one blast would break more ground when you have a floor to break to, than two blasts would break when you have no floor to break to. This is a well-known and established fact everywhere in blasting ground. Again, you have got a solid foundation for your timbers to stand on, and again, when your bedrock has been thus exposed, you can take up all the water there is coming down the channel, and convey the same out through the tunnel, thus cutting off to a great extent and perhaps all of the water now flooding your incline. Were you to breast out your gravel now, or before you get the bedrock, the following results are bound to follow: In the first place you would be taking out your poorest ground and leaving the best behind you, or under your feet.

"It would cost more to take it out, because you would have no natural floor to work to. And the floor which you would have to work to would have to be made by hard work and giant powder thrown in besides. You would have no good footing for your timbers and your waste dirt would have to be shoveled into cars and brought out, or else throw it back on your richest ground, which you would be leaving behind you. And at some future time when you would work the ground, you would be leaving behind you, you would have to handle it all over again. The timbers you would have to use would have to be all taken out and thrown away as useless, as they would be too short to answer again, hence the timbers used and the time taken in cutting and putting them in place would be a dead loss to the company. The returns from the mill, I fear, would fail to come up to your calculations, and then a mighty growl would follow and everybody interested would be kicking, and a cry would go up that there was something wrong with the management—under the above conditions, maybe the very best—and the result, notwithstanding, would be sure to follow as described above."

Riverside.

THE GAVILAN MINE.—Work has been resumed on the old Gavilan mine, owned by a syndicate of English capitalists. Considerable bullion has been shipped from the Briggs mine, near Winchester, but only a small portion of the top of the ledge has been worked, and preparations are under way for carrying on the work on a larger scale.

A REPORTED STRIKE.—A strike is reported about a mile south of the Santa Rosa mine. At a depth of twelve feet the ledge discovered opened out to a width of six feet. One assay of the ore went to $130, and another as high as $400 per ton. As soon as the fact became known the country for a distance of 12,000 feet all around was taken up.

San Bernardino.

BIG COTTONWOOD DISTRICT. — Messrs. Sweeny and Muir have located a gold-bearing quartz mine in the Montenegro district, which they have named the "Leoti."

It is located on base line, about 120 miles east of San Bernardino, one mile northwest of the McKinley Bill mine, two miles southeast of Virginia Dale, thirty-five miles from Bagdad, on the Atlantic and Pacific Railroad, about fifty miles from the Southern Pacific, and about twenty miles from the celebrated McHaney mines, with plenty of water within five miles. It is a different ledge and rock from the latter, and is evidently a portion of the ledge of the Supply mine, located from one-fourth to half a mile from it, where they went down 110 feet in a seven-foot vein, that averages $65 per ton. The Leoni commences at the top of the mountain and runs down. So steep is the mountain at that point that the end of a tunnel run in 500 feet at the bottom of the claim would be 1000 feet from the surface above it.

THE ROSE MINE.—At the Rose mine, three miles from the Morengo King, beyond Bear valley, a large force of men is in a seven-foot vein, 400 feet down, in which there is a strip about twelve inches in width yielding from $300 to $500 a ton.

THE JOHNNIE MINE.—The new Huntington mill at Montgomery, in the Vanderbilt district, is completed and the old one repaired. Both are running on their full capacity on ore from Johnnie mine.

The *Times-Index* of San Bernardino claims that gold was discovered in that country long before the discovery of gold in the northern part of the State by Marshall. It says the precious metal was discovered in the San Bernardino range as early as 1841, and that the first shipment of gold to the East from California came from that range of mountains. The shipment amounted to over $1000, and the gold was remarkable for its purity. It also says that the location of valuable mines in that section was known to the priests long before Marshall's discovery in Northern California.

Mines in the Calico district are reported working to their full capacity, and the thirty-stamp mill is kept running day and night.

Some more borax deposits have been partially developed near Dagget.

THE DESERT QUEEN.—*Times-Index:* The Desert Queen, in the Pinon Mountain district, was discovered by the exposure by the operations of nature of a large plow-out on the brow of a hill. There the ore is denuded for about ten or fifteen feet in height and is traceable for several feet along the vein until it becomes a simple stringer at either end.

The surface croppings were rich and the property has been a producer since its discovery, sufficient ore having been milled at the two-stamp mill of Holland & Tingman to pay all expenses to date. Not much free gold appears in the ore, but it is rich, as the mill returns conclusively show.

But little development work has been done beyond the construction of roads, etc., for the hauling of the ore and bringing in supplies. The vein appears to be quite flat, as it can be traced on two sides of the hill. The development thus far bears this out, as the incline is now about four feet wide.

The mine was visited by F. H. Lane, of San Francisco, to see if it would justify the investment of $2,000,000. It is only a prospect as yet, and no agreement could be reached with the owners as to developing the property before purchasing.

Mr. Lane stated that after they had completed sufficient development work to demonstrate the value of the property he would make another visit and take the property if the showing justified it, and pay a good round figure for it.

In the meantime the owners will continue development work, and soon expect to have a five-stamp mill of their own at work.

San Diego

THE RICE CAMP.—Several new strikes are reported in the Rice gold camp, east of Warner's, San Diego county, and mining men are beginning to show an interest in the district.

Sierra.

STARTED UP.—The El Capitan or Rising Sun Company will start their new ten-stamp mill this week. The ledge is of good size and looks well.

Siskiyou.

MINING NOTES.—*Journal:*—Loveridge & Co., of the South Fork of Scott river, took out $800 in two days, and realize a steady yield of coarse gold.

Espey & Co. have the foundation ready at Shasta river for setting their 200-horse power pump in position, to raise water to their new flume for carrying water towards Hawkinsville from top of the hill over 500 feet above.

The miners in the dry gulches and small streams up in the mountains are busy washing pay gravel before the water gives out.

The latter part of last week Carrick & Bailey had a crushing at McCook's mill of eight tons of ore from their mine at Greenhorn, which yielded $800.

Songer & Dame, lessees of the McConnell & Quinne or Pacific river mine, on the island just below the mouth of Humbug creek, on the Klamath, are crowding the work with a large force. They are putting a current wheel in the river to operate the electric light plant, letting the steam engine furnish power for the derrick and China pump used in clearing the seepage water.

Trinity.

COMPANY FORMED.—*Journal:* The Trinity Consolidated Mining Company was incorporated last week in Red Bluff. W. H. Fowler, well known in this country, is superintendent. The company have leased a mine on Dog creek about six miles west from Delta and will work it. They intend putting up a ten-stamp mill.

Tuolumne.

GENERAL NOTES.—*Democrat:* F. and G. Pedro have taken it out big in the Simonich claim on Bald mountain. They took out $700 in one day.

Geo. Wainwright and partner have taken out a large pocket in the Stewart-Wainwright claim on Bald mountain. One piece of gold amounted to $300.

The Keltz mill of fifteen-stamps is in constant operation. Twenty-five men are employed in the mine and mill. The lode is well defined and is yielding handsome profits.

The S. S. Badger Company are making extensive preparations to work the Wilkinson placer claims, of which there are over 3000 linear feet along the river, and after subsidence of the river will employ eighty men.

Yuba.

LIVENING UP.—A company has been organized representing sufficient capital to thoroughly prospect certain claims and new discoveries in the vicinity of Brown's valley. J. C. Campbell of Brownsville, is the leader in this venture, and will have charge of the work. Work will soon be done on one or more old claims in the vicinity of Smartsville and Mooney Flat, and on a new development near Spenceville. The "R. C." quartz mine and mill, located at Brownsville, will be started up again as soon as arrangements are completed for some new machinery. The R. M. Johnson quartz mine and mill, located near Brownsville, has passed into the hands of new owners, or there has been new owners added who have the means to work the mine in a way to make it pay larger dividends. Two or three new discoveries in the vicinity of Brownsville and New York Flat will be worked this season, the prospects being such as to warrant placing machinery on them.

NEVADA.

Storey.

THE CROWN POINT TO START.—*Enterprise:* Empire, which has been under water for several days, is gaining some relief. The flood is abating, and what a few days ago promised to become a veritable Nevada Venice has proved to be nothing more than a succession of muddy wastes. The mills along the [illegible] been closed down on account [illegible] start up to-morrow, and [illegible] will put on its quota of [illegible]

y Mail, 10c.

THIS CUT ONE-HALF SIZE.

ARIZONA.

HASSAYAMPA DISTRICT.—The shaft [illegible] Zero mine in the Hassayampa district is [illegible] nearly one hundred feet and when that [illegible] is reached the owners will stope out ore.

pine has already produced about $50,000 worth of ore even at the low price of silver.

GOING DOWN.—The old cry of a class of so-called miners of this section, "that our mines do not go down," is being rapidly disproved by the new class of genuine miners who have taken hold here says the *Journal-Miner*. It is the miners and not the mines that did not go down. It is a fact however that the mines of this section have had a reputation abroad of pinching out at a very small depth. The Congress is down 1,300 feet, the Little Jessie over 600, the McCabe 300 and other mines from 300 to 700 feet and the experience of attaining depth, in all of the properties, where the owners have had the nerve and enterprise to sink, has been that the properties improved with depth. Two samples of ore, taken from the Little Jessie at a depth of 500 feet and the other from the McCabe at a depth of 300 feet, show that the ledge was good and strong from which it was taken. It is a sulphuret ore and went $340 per ton in gold. The sample from the McCabe mine, while being smaller in thickness, weighed about five pounds and was about two thirds free gold.

WANTS DAMAGES.—Geo. Gicker, of White Hills, has brought suit against the White Hills Mining Company for $10,000. One of the top workmen on the Grand Army mine pushed a mining car down the incline shaft that crushed Mr. Gickers leg so badly that it had to be amputated above the knee.

BRITISH COLUMBIA.

A BUSY SECTION.—Never were so many men drawing pay in Kootenai as now, says the Nelson *Tribune*. The payrolls are not all at any one place. At Rossland the payrolls of the mines and local enterprises will aggregate $1,000 a day: at Nelson and immediate vicinity, $400; at Pilot Bay, $150; at Ainsworth, $250; at Kaslo, the building of the Kaslo & Slocan railway will cause fully $1,500 a day to be disbursed for several months; in the Slocan, the pay rolls will aggregate $500 a day even now when little more is being done than dead work at any of the mines. It is safe to say that the disbursements for wages in southern Kootenai aggregate $120,000 a month. And what is better still, the mines of the country are producing every dollar that is being disbursed.

COLORADO.

THE FLORENCE REDUCTION WORKS.—The United States Economis Reduction Works, completed some time ago, but which have been undergoing a series of changes, are announced as a complete success in every particular. These works have just finished two independent runs to extract the gold from the ore which had previously been pulverized and roasted, and the trouble of successfully filtering this ore has been fully overcome. These works embody nine radically new features in ore treatment and the first of the kind ever erected, hence not only the construction of the machines, but the entire arrangement and relation to each other had to be fixed and decided upon without being able to refer to any other existing mill. In spite of this fact all of the changes which the company was compelled to make could have been made in a week's time had the material therefor been quickly available. The works which are now arranged for chlorination principally will now receive further apparatus so as to fit them for the treatment of ores by any wet process, which means the expenditure of considerable more money. The capacity of the entire plant will be doubled, being increased from 100 tons daily to 200 tons and no effort will be made to run the plant until the additions have been made, which will require about two months' time.

IDAHO.

IN THE COEUR D'ALENES.—The situation around Wardner is unchanged and will remain so until a definite reply is received from the officers of the Bunker Hill and Sullivan Mining Company. This answer, it is expected, will be brought by Manager Bradley himself, who last week was in Nevada county, this State, where he has a gold property of his own. He has not severed his connection with the Bunker Hill, and it is understood that when the mine starts he will be on hand to superintend the first turning of the wheels. The openly expressed opinion of Wardnerites is that when the mine is ready to start it will be given safe conduct through any possible turbulent times that may ensue.

OREGON.

JOSEPHINE COUNTY.—John C. Lewis, who has spent a large sum in developing his mines in Mount Reuben district, has struck a body of rich ore at a depth of 700 feet.

CLACKAMAS COUNTY.—Within the past week fifteen mining claims have been located in the neighborhood of the Red Rock lode, near the headwaters of the Clackamas river.

BAKER CO.

CROCKEN CREEK DISTRICT.—On the Eureka and Excelsior mine 30 stamps are in operation. The ore is base and difficult to treat. A 20-stamp mill is being operated on ores which are concentrated and the sulphurets shipped to the smelters. A 10-stamp mill is running on ores on which the cyanide process is being worked, this being the first instance of the successful working of the cyanide process in the treatment of Oregon ores. A great deal of money has been spent in experimenting with ores from the E. & E. mines, carload shipments have been sent to Denver, Eastern and even European cities [illegible] mented with in an endeavor to find method of treating the lower [illegible] too great loss. The [illegible] seems to have [illegible] lines are now [illegible] which is a southerly [illegible] and Excelsior, has [illegible] loped and operated successfully [illegible] years. The ores uncovered [illegible] known in both quantity and quality [illegible] one of the large and valuable [illegible] of the district. An extensive exploration and reduction plant will be erected this year. Shipments from the Columbia last year netted over $100 per ton. Considerable development work is being done on this and several other properties in the Cracker Creek district.

PLACER MINES AT GLENDALE.—William H. Taylor, manager and owner of the Victory placer mines at Glendale, in southern Oregon, states: "We have struck, and within a week will be working on true bedrock. The gold found therein, assays being made from twenty places along the new cut, just completed, gave us 940.8 fine, and weighing over fifty cents per cubic yard."

SOUTH DAKOTA.

THE HIGHEST ASSAY.—*Pioneer*: The new find in the Deadbroke tunnel on Blacktail breaks the record for high assaying. The tunnel is in something like 1,000 feet and a black slimy sort of stuff was encountered which slid through the batteries and over the plates. An assay of the stuff was made and it was found to be clay and plumbago carrying gold to the value of $71,000 per ton. It is not known how large the pocket is, or how soon it will be gone. The tunnel matter is cement and the clay and plumbago lie on bedrock in a small vein. There may be a ton or more of it and then there may be only a hundred pounds or so.

UTAH.

THE EUREKA-HILL.—Within the week the twenty additional stamps for the mill of the Eureka-Hill will be received at Eureka. With the addition of these twenty stamps the mill of the Eureka-Hill will be of sixty stamps capacity, one of the largest in the territory. No new pans are necessary, the plant now being equipped with pans and power sufficient to take care of eighty stamps.

A UINTAH SCHEME.—Some months ago the *Tribune* gave some attention to the Uintah Mining Company, and expressed the opinion that its promoters had accomplished a most remarkable achievement in financiering. Owning nothing but a lease and bond on a mortgaged interest in the Dolberg group of mines, they had incorporated a company, with a capital of $6,400,000, and actually succeeded in selling considerable stock in the East. The *Record* has made an investigation of the Uintah Company, with the following result:

The office, works and boarding-house were all visited, and not a soul was to be found anywhere, the whole works having been deserted. After diligent inquiry at the surrounding mines, and from men working in the immediate vicinity, it was learned that the two men who had been left in charge after work had practically been abandoned, had pulled up stakes Sunday last and moved out. In fact, while there has been a pretense of working the property all winter, very little has been accomplished, and no real showing has been made for the time put in. It looks very much as if a small force had been kept at the property more as a blind than with any evident intention of honestly developing the ground, and the men employed at adjacent works all say there appears to be something wrong about the company. Timbers and supplies have been secured on credit, and never paid for, while one of the men who formerly worked for the company says it owes more than $1000 for wages; that no ore was cut in the shaft, and that the company is no good.

WASHINGTON.

METALLINE DISTRICT.—Metalline remained dormant for ten years but now promises activity. Stages will run across the range to the once-isolated Metalline camp, on the Pend d'Oreille river. Preparations are also being made to open the river through Box canyon to admit of steamer transportation from Newport, on the Great Northern, down the river to Metalline, which will then be the foot of navigation on that river.

The ore in the camp is mostly galena and is heavily charged with silver. It has always been classed as a low-grade camp, in which the assays would show from 60 to 70 per cent lead and a dozen ounces of silver to the ton.

Placer work has been the chief pursuit in Metalline since it was first known, and trappers and prospectors have divided their time between hunting and mining. The deposits of gravel on the east side of the river are rich in gold, and much ground has been found which will average 50 cents in gold to the cubic yard. At the mouth of one of the creeks putting into the Pend d'Oreille just above the obstruction to navigation in the river, above Metalline, is a delta formed from the washings from the mountains that is pronounced the richest deposit in that country.

WANTED.

A man who has had experience with White & Howell Roaster, for mine in Mexico
Address, stating references and wages expected, Box H, this office.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

No dust. No ashes. Cheap, effective, economical, portable and automatic.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.
The American Mining & Milling Machinery Co., Cleveland, O.:
GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out hubr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows less; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with less than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,
CLEVELAND IRON ORE PAINT CO

The Old and the New in Hydraulic Practice.

The wheel illustrated on this page is of the type commonly known as the overshot or gravity wheel, and is unquestionably the largest and most expensive water wheel ever constructed. It is located at Laxey, on the Isle of Man, a small island in the Irish sea, off the west coast of England.

The wheel is 72 feet 6 inches in diameter, and is supposed to develop about 150-H. P., which is transmitted several hundred feet by means of wooden trussed rods having supports at regular intervals, to the bottom of which are attached small wheels running on iron ways, for the purpose of lessening friction. The power thus transmitted operates a system of pumps in a lead mine, the duty of which is raising 250 gallons of water per minute an elevation of 1200 feet. The water is brought some distance to the wheel in an underground conduit, and is carried up the masonry tower by pressure, flowing over the top into the buckets.

This great wheel was constructed some forty years ago, and is said to have been running continuously during all this time. It is the great attraction of the place, hundreds of visitors making the trip to the island every year to see it.

The illustration referred to affords a very good idea of the progress made since that time in hydraulic engineering, and is reproduced for the purpose of showing, by way of comparison, the advantages of the modern and now generally accepted method known as the Pelton system of power.

The little cut in the upper corner represents a Pelton wheel of corresponding capacity under similar conditions of head and water supply, being drawn to the same scale.

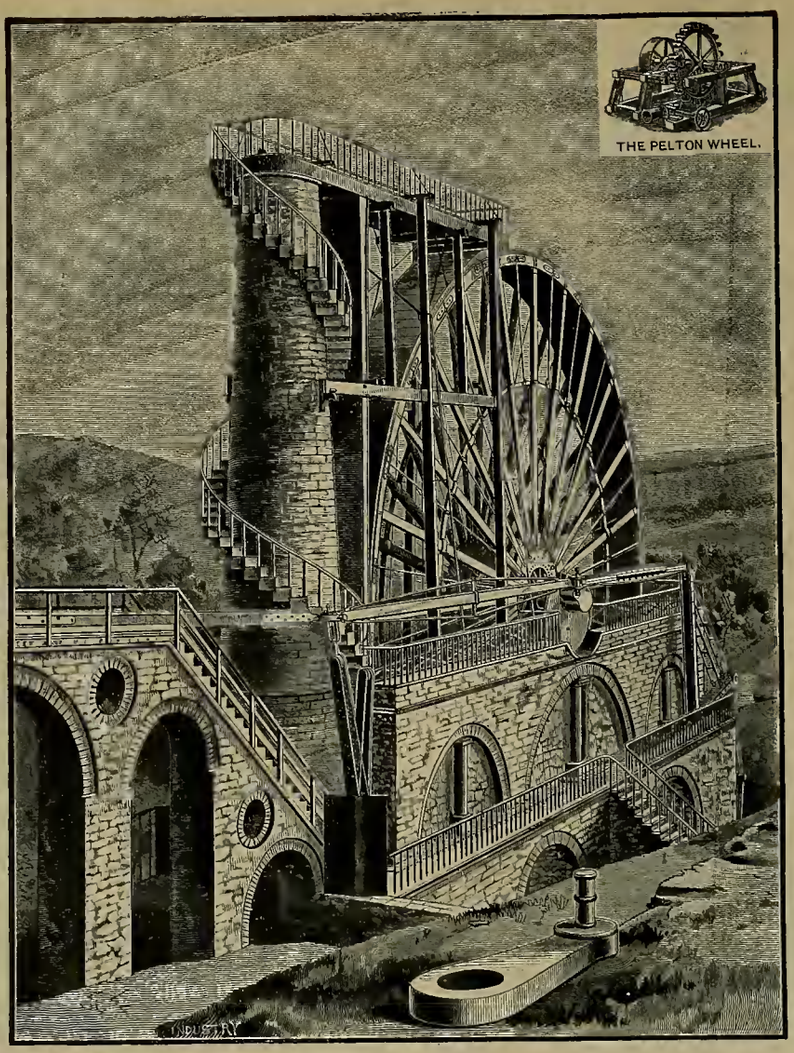
The extraordinary results obtained from this well-known wheel are due to the peculiar shape of the buckets into which the water is directed from one or more nozzles, so that the full energy due to its head or fall is transferred into the inertia of the wheel. The power represented by the force of the water is thus converted into mechanical movement almost entirely without friction, the buckets simply taking the energy out of the stream and leaving the water inert under the wheel.

The efficiency of the Laxey wheel—taking resistance into account—it is estimated cannot be more than 65% of the theoretical power, while the Pelton will develop fully 20% more, and in size and appearance is a mere toy as compared to the ponderous piece of machinery shown, with is massive column, arches, and stone foundations.

The most striking contrast, however, will be seen in the matter of cost, which is so much less as to make a comparison almost absurd. While no data is at hand in regard to this, it is apparent that it would be at least as one to fifty in favor of the Pelton.

Such an object lesson is of value in showing the wonderful progress made in engineering practice during the last half century, in bringing the forces of nature into subjection, making them subservient to commercial and industrial purposes.

The Pelton system of power has now come into use in every civilized country on the globe, and is conceded to be one of the most useful, as well as most illustrious, inventions this country has ever produced, making possible the utilization of this great natural motive force under all conditions and for every variety of service, with a useful effect never before obtained, and in so simple a way that machinery may be said to be almost dispensed with.



THE PELTON WHEEL.

Formosa's Unknown Interior.

The interior of Formosa is apparently still but little known, the Chinese authority being limited to the western coast country, the extreme northern part and a narrow strip of the east coast. The Chinese are gradually working their way inland, cutting down the forests and replacing them with indigo and tea plantations. Much of the soil is extraordinarily fertile. In some places there are three rice harvests in a year, and tea leaves are picked three times—in many places, indeed, seven times—a year. Anthracite coal of good quality is found in large quantities, and close to the sea—a thing of great importance to maritime powers like Japan. Alluvial gold has also been discovered in the beds of some of the northern streams. The Chinese have built a railroad from the port of Kelung, a distance of about 100 miles, to a town near the west coast.

FOR TIRED EYES.—Take a cup brimful of water. Add sufficient salt to be just perceptible to the taste. Hold your eyes to the water so that your lashes touch it, then wink once and the eyes will be suffused. Do not wipe them. This so refreshes the eyes that they feel like a new pair. Do not forget the good old rule—as soon as you "feel your eyes," stop using them. By following this treatment, very little time will be wasted waiting for tired eyes.

MODERN INDUSTRY has a foothold in the Arctic regions. Mines are worked on a large scale and a railroad regularly operated in such high latitudes. This is the case in Sweden, where the Lulea-Gellivare Railroad, built for the purpose of carrying iron ore from the Gellivare mines to the seaport of Lulea, extends fifty miles above the Arctic circle and enjoys the distiuction of being the first railroad to open up the frigid zone.

GLADSTONE computes that the habitual speakers of the English language have increased from 15,000,000 to 105,000,000 during the last 100 years, and that they will number 120,000,000 by the end of the year 1900. At that rate of increase, which is seven-fold each century, such speakers will include not less than 840,000,000 by the end of the year 2000.

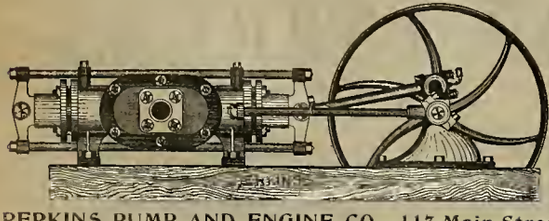
Riveted Iron and Steel

Water Pipe

For Hydraulic Mining, Mills and Power Plants.

IRON, CUT, PUNCHED AND FORMED, AND TOOLS SUPPLIED FOR MAKING PIPE ON THE GROUND WHERE REQUIRED.

309 to 317 Market Street, San Francisco.



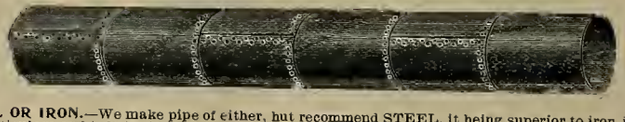
MINERS' FAVORITE

Perkins Double-Acting PLUNGER PUMPS.

Capacity 2000 to 20,000 gals. per hour. Especially adapted for mines. Will raise water any height or distance and can be worked successfully under every possible situation. Pumps sand and water. No cylinder or pistons to wear out. For all particulars send to the

PERKINS PUMP AND ENGINE CO., 117 Main Street, San Francisco.

Mining Pipe!



STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.

COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.

COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

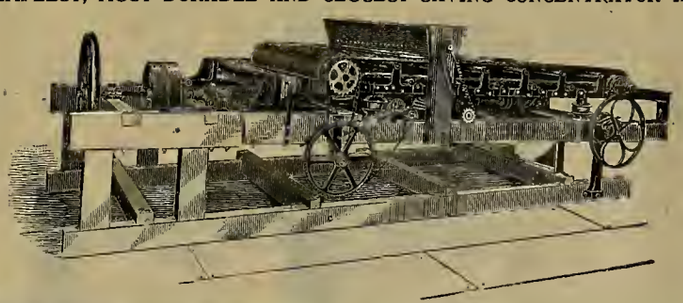
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.
PRICE.....$350 EACH
including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works

Market Reports.

The Markets.

SAN FRANCISCO, May 23, 1895.

There is a general advance and a firmer demand in all the metals. Latest New York advices report considerable excitement in various branches of the metal market and rapid movement in prices. Operations in copper, chiefly in London, averaged over 3000 tons per day. Speculation was stimulated by reports that American producers had decided to limit the amount of copper they would ship to Europe, and that foreign producers had practically agreed to restrict their output about 7½ per cent. In neither instance, however, did anything more than a qualified verbal agreement seem to be made, and it appears that one prominent mining company withdrew from the compact because of improvement in their sales at home and abroad, and favorable outlook for the future.

This was the signal for a bear raid in the London market and the circulation of reports calculated to harm outside operators who are not well informed as to the true situation on this side of the Atlantic, and prices receded in London. Meanwhile considerable business was effected in New York, not only with consumers but among dealers as well. The Calumet and Hecla Company, it is understood, has sold its entire product up to and including July, and some of the other Lake Superior companies are as comfortably situated, while the Arizona and Montana producers are in such position that they do not compete for business as sharply as usual. The increase in consumption of copper has been largest among manufacturers of electrical supplies, but manufacturers of sheathing, brass, tubing, etc., have been enjoying a brisk trade and purchased crude material accordingly.

Pig lead has also advanced, and is about 1⅛c per pound above the lowest point of the year. The impression has prevailed that the National Lead Company were the heaviest buyers, but it is learned on very good authority that such is not the case, and that more lead has been taken up by operators prominently identified with the tin business than in other quarters. The statistical position of the metal is regarded as being exceptionally strong in this country and in Europe, but necessary data on that point is wanting.

In various branches of the iron and steel trades a good business has been effected, and there is some indication of toning up of prices in a few lines, such as track supplies, rolled iron and cast pipe. In structural material the competition is still keen enough to keep prices low, and foundrymen in the East are not as yet fully employed. Crude material has undergone no radical change in price, but the market shows stronger tone.

Mining Share Market.

SAN FRANCISCO, May 23, 1895.

Nothing new nor nothing good is reported on the street this week, the "general apathy" still prevailing. The market went lower, the bear clique having things generally their own way. Hale and Norcross sold down to 72c. It is expected that the long-delayed Supreme Court decision in this case will appear about next Thursday, the 30th. Whether an assessment will be in order can then be easier determined.

The following is from "*Money*," a chipper London publication that purports to give "points" on the London stock market. It is illustrative of how our British friends discuss these matters: The Kaffir market continues as steady as silver, and has as good a prospect of improving. A "bull" is always posing as being a friend of the company and of its stock, while a "bear" is supposed to be an enemy. The "bulls" are anything but friends, and so far as any improvement in prices of stock were concerned, they simply killed it. Those who say that any sharp rush in South Africans is bound to have a reaction are better friends to an upward movement than a weak-kneed buyer of five hundred shares who will be the first to sell out directly a slip-back of five shillings takes place. Nor does the trouble always end there, as *his* precipitate and nervous sale causes others to think that he has heard some bad news concerning the mine, and they evince a disposition to realize also, and, after saying to each other at luncheon that "it will be all right," they each slip off by devious bye-ways to their brokers' offices and confide in those ready listeners that they would "like to get out" of the shares—"to get out, in fact, at best." Thus may a mountainous land-slide be manufactured out of a molehill. Nothing supports a market like a good, wholesome, oversold account. Investors may swear that if a certain stock falls to a certain point they, one and all, intend to invest a thousand pounds more in it. But they don't do so, for all that. When the "limit" they have named is coming close, they cancel it by wire to their broker, because they have heard a fresh disturbing rumor. A "bear" talks equally bravely. He "knows the stock is rotten." He "cares not a tinker's curse whether the price rises another ten points." "If it does it will only necessitate his making a larger profit than he has at present fixed in his mind as being content with." He "will sell more on each one point rise." He "will never close except at a thumping profit." But he doesn't do all these things. An incipient backwardation causes some of the pluck to ooze out of the palms of his hands. Day by day he sees the price improving. He bears his next door neighbor, Brown, blandly state that he has bought for investment a few thousand stock. At length the tension becomes rather acute. There seems to be no limit to the advance, and our bold "bear" at length comes in and buys, too, to the great delight of the dealers in the market. Now, who is the best friend to the stock—the "bull" who cracks it up and sells, or the "bear" who deeries it and buys? Let no one think, therefore, that those who induce weak or reckless buying are helping the "boom," or that any critic who tries to check the pace a bit by means of a word of caution is necessarily desirous of breaking it down. To buy and carry over many of the high-priced shares now must be to expose oneself to a sharp fall, or to suck honey off thorns in the event of a profit showing. It requires strength of mind and considerable experience not to re-embark in mining ventures money gained as profit from them. The process of buying mining shares now being adopted by several small people is becoming very amusing. The plan is simply to look out any South African mine whose shares have not risen, and buy five hundred of them. A deal on these lines was made for the current account in Joe's Reef by a buyer who had never heard of the company before, yet who had the temerity to take 500 at 7s 6d. Within the past two days they have risen to 20s.

The above doesn't sound much like Pine street, but exemplifies that a Californian needn't feel lonesome if landed in the middle of the present "Kaffir circus" in London.

Turning from London to Colorado, the following extract from a Colorado Springs letter is likewise interesting:

"Trading locally during the past week was unmistakably spasmodic. The utter absence of Eastern business is painfully noticeable. The new Board of Trade Exchange, recently opened, has undoubtedly greatly stimulated local transactions, but is apparently of little benefit to brokers, as a large majority of the local speculators have identified themselves with it, and consequently save brokers' commissions. This naturally forces the broker to depend more than ever upon out-of-town business. The rates of commission on the new Board are materially less than those of either the Denver or Colorado Springs exchanges. So far as the ordinary speculator or investor is concerned, this new institution is unquestionably of great benefit, and there is no reason whatever why it should not be encouraged by every one. Of course, it may be in a way detrimental to the broker who is conducting an extensive establishment and freely advertising. Again, this may be questioned, as there is a possibility of its creating renewed interest from unlooked-for sources. It must increase local enthusiasm and general confidence. It will have a tendency to overcome the extreme quietness that invariably prevails at this season of the year."

The annual meeting of the Gold Ridge Con. Mining and Milling Company was held on the 20th inst. for the election of five directors for the ensuing year, and resulted in the election of the following: Wm. H. Lillie, C. M. Jennings, Richard Phelan, R. H. Daley, B. F. Ricker, 80,000 shares being represented.

The following illustrates the changes of the week:

Assessment Notices.

H. P. TAYLOR MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Liberty Mining District, Siskiyou county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the nineteenth day of April, 1895, an assessment of Four (4c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 39 Merchants' Exchange, 431 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the thirty-first day of May, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on FRIDAY, the twenty-sixth day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HENRY SMITH, Secretary.

Office: 39 Merchants' Exchange, 431 California St., San Francisco.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of May, 1895, an assessment (No. 49) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 2d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the first (1st) day of May, 1895, an assessment (No. 41) of Fifteen (15c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 20-22 Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the first (1st) day of June, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the twentieth (20 h) day of June, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DOOR OPENER.—Lawrence Dunn, S. F., assignor of one-half to Wm. Dunn, same place. No. 538,900. Dated May 7, 1895. This invention relates to a device designed to open doors, gates and other closures, and is especially adapted for use upon fire-engine houses, where it is necessary to open the doors the instant the horses are attached to the engine or other apparatus. It consists of a gate or door, with levers fulcrumed to the top of the door casing, one of the levers pressing against the door, a link by which the movable inner ends of the levers are connected, a weighted cord for operating the levers and direction pulleys around which the cord passes, a latching device by which the doors are retained in a closed position against the pressure of the lever, and the action of the weights and cords passing over direction pulleys whereby the doors may be released.

CAN OPENER—James Gould, Jr., Berkeley, Cal. No. 539,261. Dated May 14, 1895. This device relates to that class of can openers in which a handled wire or bar has its other end provided or formed with a cutting hook adapted to puncture the material of the can, and when entered to present its cutting edge in such a manner that upon vibrating or working the handle the cutting hook will be caused to move through the tin and to cut said tin as it moves. The object of this can opener is to provide a simple and practicable device adapted to be readily entered into and through the material of the can and to be turned at once to a position in which by the vibration of its handle or shank it can be advanced quickly and certainly in its cutting path around the can, thereby opening it. The device consists of a bar or wire forming a shank, the extremity of which is bent backwardly parallel with and upon itself, and is then flattened and formed into a forwardly projecting hook having its inner edge reduced to a cutting edge, and its extremity projecting beyond the extremity of the shank and reduced to a cutting point.

PROSPECTING

Mechanics; Mechanical Drawing; Electricity; Architecture; Architectural Drawing and Designing; Masonry; Carpentry and Joinery; Ornamental and Structural Iron Work; Steam Engineering (Stationary, Locomotive or Marine); Railroad Engineering; Bridge Engineering; Municipal Engineering; Plumbing and Heating; Coal and Metal Mining, and the English Branches. Blowpiping outfit and mineral specimens *free* to students. Send for Free Circulars, stating the subject you wish to study, to

GLADSTONE MINING COMPANY, C. J. Clark, M. E., Gen'l, Supt. FRENCH GULCH, Shasta Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

VOLUME LXX. Number 22. SAN FRANCISCO, SATURDAY, JUNE 1, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

New Life in the Comstock Tunnel Co.

At a meeting of the shareholders in the Comstock Tunnel Company (formerly Sutro Tunnel Company) held at New York City on April 25, 1895, the following directors retired: Theodore Sutro, Otto Lowengard, Julius A. Stursberg, Elisha Dyer Jr. and Wheaton B. Kunhardt, and the following were elected: Franklin Leonard, R. H. Hobart Smith, H. H. Truman and Gordon MacDonald. The new directors elected Franklin Leonard president and Gordon MacDonald treasurer. It is semi-officially reported that Mr. Leonard represents large capitalists and Gordon MacDonald represents a Mr. Van Weel of Holland and Robert Fleming of Scotland, while Messrs. Smith and Truman are bankers at New York. This change undoubtedly points the way to far better times in the near future for the mining industry at Virginia City, Nevada, which in turn will give an impetus to mining in the State of Nevada and, as for that, throughout the coast that will bring about an activity to which the industry has been a stranger for many years, and, when an accomplished fact, will produce an era of general prosperity in Nevada and California, with its favorable influence felt in neighboring States and Territories. This opinion is grounded on the fact that ever since the tunnel was in litigation—which is now happily at an end—mining has been only spasmodically active. This, to a large degree, is due to the fact that the mines on the Comstock lode are listed on the San Francisco and New York exchanges, and the shares dealt in at both places. These quotations being given publicity through the press, causes many not conversant with mining on this coast to consider them the "open sesame" to the industry. This opinion is also due to their phenomenal output of gold and silver, aggregating fully $400,000,000. That the tunnel is most unquestionably an important factor at Virginia City will be readily recognized when it is considered that it drains the Comstock and several other lodes at a depth which makes it possible for the mines to be worked at a large reduction in expense and deeper, if found necessary, than they possibly could be otherwise. In its construction it took fully nine years—from October, 1869, to 1878—before the main tunnel was completed to the Comstock lode, a distance of 20,489 feet. The lateral tunnels which follow the trend of the lode uorth and south were constructed since. The south lateral tunnel was extended to what is known as the Forman shaft, a distance of 8423 feet from the main tunnel, and the north lateral tunnel was extended a distance of 4403 feet up to the Mexican Mining Co.'s ground. These combined with the main tunnel make a grand total of 33,315 feet, or over six and one-third miles, fully completed aud equipped for working purposes. It is furnished throughout with car tracks and side switches, drain boxes and ditches to carry off the water, ventilating shafts, partitions, and everything necessary to make it complete in every respect. The height of the tunnel is generally from seven to seven and onc-half feet and the width throughout eight feet at the top of inside timbers and nine to nine and one-half feet at the track rails ou the outer bottom. A better idea can be formed of the tunnel by the plat or drawing herewith shown. Compared with similar tunnels in other mining districts the Comstock tunnel is a small affair, but when pushed to its full contemplated length (three miles further than now completed), with its many lateral tunnels, it will take rank as one of the longest, most thoroughly built and best equipped now in existence. The greatest adit or drain tunnel is at the United Mines, near Redruth, in Cornwall, which, with its branches, has a length of thirty miles. This tunnel has been in use ever since the year 1768. The next longest is the Ernst August tunnel, which has a length of fourteen miles, and which drains the mines in the Hartz mountains, Germany. Although the Comstock tunnel takes rank as the third largest of a similar kind in the world, it outranks all others in the number of distinct lodes run through, area of untold wealth and value of its

Mineral Land in Northern California; Cripple Creek's Fine Native Gold; South African American Exposition; Where Wampum Is Still Used; Coast Industrial Notes, 346. Riedler Pumping Engines, 351. Notices of Recent Patents, 354.

THE full text of the new Mexican mining law is published elsewhere. Senor Romero, the Mexican Minister, says that the intent of the bill is to distribute over the whole of that country's mining industry the high duty now levied on silver mining. If it tends to keep Mexican lead and copper out of this country, as would appear from its provisions, American producers of those metals will not object.

SO MUCH has been said first and last in these columns about the mineral area of the State and its attempted perversion, the effort on the part of the miners to prevent its absorption, and the progress of the work, that little remains to say beyond urging a full attendance at the meeting of the Executive Committee of the Cal. Miners' Association at the Palace Hotel in this city next Thursday evening. Such communications as that of Mr. Bell, of Shasta, published elsewhere, illustrates the spirit and sentiment of the California miner. The recent attack "all along the line" of the Sacramento papers (and all the other papers of the State that could be coerced or influenced) on the mining interests of the State in general illustrates the spirit and sentiment of the corporation that evidently influence such utterance. The cuttlefish tactics that darken the waters of debate are again employed; but, undismayed by the private and public activity of their wily antagonist, the Miners' Association will go on in successful effort to thwart corporation absorption and secure manifest justice for the commonwealth, in whose interests, in the larger sense, the present contest is being made.

THE country's railway tonnage is something stupendous. The whole of the tonnage on the oceans of the world last year aggregated 140,000,000 tons; the tonnage of the railway companies of the world, carried 100 miles, aggregated 1,400,000,000 tons. There are 400,000 miles of railroad in the world, of which 180,000 are in the United States. Of the 1,400,000,000 tons carried 100 miles last year on the railways of the world, 800,000,000 tons were carried on the railways of the United States. Take the 600,000,000 tons carried 100 miles on the railways of the world outside of the United States, and add to it 140,000,000 carried on the ocean in the commerce of the world upon the seas, and still in the 800,000,000 tons carried on the railways of the United States there are 60,000,000 tons more than on all the railways of the world outside of the United States and in all the ocean commerce of the world put together. This traffic is carried by the American railway at an average of eight mills per ton per mile: the railways of Great Britain charge two cents and eight mills; France, two cents and two mills; Germany, two cents and six mills; Italy, two cents and five mills; Russia, two cents and four mills. The internal commerce of the United States makes our country the most wonderful market this globe has ever known.

New Life in the Comstock Tunnel Co.

(Continued from preceding page.)

franchise rights given by a special act of Congress, passed July 25, 1866. This act, whereby the right of way is granted, reads as follows: "For the purpose of the construction of a deep draining and exploring tunnel to and beyond the Comstock lode, so called, in the State of Nevada" * * * commencing "at the hills near Carson river * * * and extending from said initial point in a westerly direction seven miles, more or less, to and beyond said Comstock lode; and the said right of way shall extend northerly and southerly on the course of said lode, either within the same or east or west of the same, and also on or along any other lode which may be discovered or developed by the said tunnel." The act also grants the right "to purchase, at one dollar and twenty-five cents per acre," public land, "not exceeding two sections" near the mouth of the tunnel. It also gives "the right to purchase, at five dollars per acre, such mineral veins and lodes within two thousand feet on each side of said tunnel as shall be cut, discovered or developed by running and constructing the same, through its entire extent, with all the dips, spurs and angles of such lodes," etc. The Comstock lode and all other lodes, "at the passage of this act in the bona fide possession of other persons, are excepted from such grant;" but such lodes, if not worked as provided by law, become subject to such right of purchase. * * * It is also further enacted "that all persons, companies or corporations owning claims or mines on said Comstock lode or any other lode drained, benefited or developed by said tunnel," shall contribute and pay to the owners of said tunnel for benefits derived such charges as shall be agreed on by and between said owners and the companies representing a majority of the estimated value of the Comstock lode at the time of the passage of the act. The agreement made in conformity with the act carried certain fixed charges on every ton of ore extracted and milled, being $2 a ton on all going above $40 a ton and $1 on all going below $40 a ton. There was also to be collected 25 cents a ton on all ore, rock, earth or debris removed through the tunnel, besides collecting fare on each person carried and on all freight transported. About two years ago the charges for ore extracted, reduced or sold were reduced by the late owners to four per cent royalty on the net proceeds of all bullion extracted and 40 cents a ton on waste sent out through the tunnel. This reduction makes it possible to mine low-grade ore at a profit, and induce mining for the latter instead of extended dead and prospecting work which did not yield a revenue, except in isolated instances, to the tunnel company and only brought assessments to shareholders in the different mines. The litigation between contending interests for the Comstock tunnel placed the mining companies in an unenviable position, one that did not either encourage mining below the tunnel level by pumping, or extensive prospecting or developing (outside of keeping the industry alive) work above the tunnel level, owing to their not knowing into whose hands the tunnel would fall, by whom it would be allowed to go into disuse and eventually be abandoned or else prosecuted still farther west through Mount Davidson, with more necessary branch tunnels built so that mining can be better prosecuted with safety, less expense and more advantageously. With the change in ownership, as noted in the fore part of this article, comes assurance that capital is at its back and fears need no longer be entertained that the tunnel will not be pushed to completion in all directions, admitting of more thorough working of the different mines and extraction of ore which would not in preceding years pay but which will now, under cheapened charges for tunnel royalty, transportation and milling.

To more fully determine the importance of the tunnel, with its valuable franchise rights, it is only necessary to trace results in prosecuting the work of extension, together with seemingly well authentic statements regarding the large deposits of low-grade (gold-bearing) ore discovered by the different mines located on the Comstock lode, which can be, and unquestionably will be, extracted and reduced under a better condition of affairs after the new owners of the tunnel get well under way. In extending the main tunnel the Star or Bella Union lode was struck at a point 10,500 feet from its mouth. From this lode fair assays were secured from the vein matter encountered. Farther on, say about 1000 feet, at a depth from the surface of 1361 feet, the Brunswick or Monte Cristo lode was struck. This lode increases in width as depth is obtained, being about 100 feet wide at the tunnel level. It is said to be a strong vein and known as a true fissure. On the surface it has been traced by croppings for a distance of over two and a half miles. On this lode is located the Monte Cristo mine on the north and Occidental on the south. It is estimated that fully three-quarters of a million dollars in bullion have been taken out near the surface. It is stated by mining experts that fully 2,000,000,000 tons of low-grade ore are contained within the boundaries of the Brunswick lode, which, at the low estimate of $5 a ton, would mean in bullion ten billion dollars. The next lode struck was the Solferino, and, still farther on, distinct vein matter was struck. The above lodes, like the Comstock, dip easterly at an angle of about forty-five degrees. In running the south lateral tunnel, at a distance of 4035 feet from the end of the main tunnel they struck east of Yellow Jacket, a vein was struck having an average width of nine to thirteen feet, named the Garfield lode, which gave an average assay value of nearly $18 to the ton. Owing to the lack of funds the different finds have not been prospected to any extent, therefore they remain largely an unknown quantity. What will follow extensive and thorough prospecting work on the veins cut by the tunnel, and what new veins might be cut and discovered by running drifts in various directions along the main and lateral tunnels, is largely problematical, without taking into consideration what is liable to be found by extending the main tunnel three miles farther west and passing under Mt. Davidson at a depth of 3600 feet below its summit. A fair idea of what can be found in its extension through Mt. Davidson can be formed by what has been discovered on the surface, but which, owing to water interference, could not be worked to any depth. This, of course, will be overcome by the tunnel being extended so as to give drainage facilities.

A late map of the Comstock lode and mines located on it shows the Virginia or Red lode lying to the west. The West Con. Virginia and California mine are running for the latter lode. This work was commenced on the 1100-foot Con. Virginia and California mine. It is expected that this drift will strike the Virginia lode about 1600 feet west of the Comstock lode and at a depth of 1600 feet. In extending the Comstock tunnel this lode would be struck at a depth of about 2400 feet, which will give ample drainage facility so as to admit of its being opened up and the mines located on it worked advantageously to that depth. According to mining men well informed of the different lodes in the Comstock mining districts, the Comstock tunnel in its extension west would run respectively through the following lodes before getting under Mt. Davidson: Middle, Virginia or Red and Cole. These are called gold-bearing lodes, as the percentage of silver in the ore is small. It is the belief with mining men that the two last-named lodes will be found to be very rich in gold and yield immense wealth to the owners of the mines located on them when the tunnel is pushed west so as to drain them. What is on the west side of Mt. Davidson is largely problematic, but there are those who contend that if the tunnel is pushed under and on through Mt. Davidson some important and valuable gold-bearing lodes will be run into.

Intimately connected with this new life in the Comstock Tunnel Co. is the present effort making to infuse vitality into the life of the Comstock lode itself. The matter has taken definite shape, and includes a proposed amalgamation of interests in this direction of the Con. Cal. & Va., Gould & Curry, Hale & Norcross, Best & Belcher, Chollar, Potosi, and Savage, to acquire joint control of the Brunswick, lying about a mile east of and parallel with the Comstock. The idea is to buy 5000 feet of the Brunswick lode, including the St. Johns claim, 2900 feet southward of the tunnel, and the Alahama and Bailey claims, which extend 2100 feet northward. At the meetings so far held there has been unanimity of action, though it is probable the first

named of the seven will not finally conclude to be an active participant. Should there be the proposed pooling of issues there will be considerable consolidation and lessened expense in company management, etc., and a pro rata sharing of expenses and profits in developing the property purchased. In the outlined development of the property under consideration the Comstock tunnel plays a prominent part.

The following are the depths from the hoisting works of the leading mines to the level of the Comstock tunnel or its branches; also the angles of the inelines, where there are inelines from the bottoms of the main vertical shafts:

Utah, 1465 feet; angle of incline, 46°; Sierra Nevada, 1501 feet; Union shaft, 1502 feet; Ophir, 1600 feet; pitch of ineline, 37°; C & C shaft, 1510 feet; Con. Virginia, 1625 feet; Bonner shaft (Gould & Curry mine), 1676 feet; angle of incline, 55°; Gould & Curry and Best & Belcher shaft, 1448 feet; Savage shaft, 1650 feet; pitch of incline 38¾°; Hale & Norcross, 1626 feet; pitch of ineline, 40¼°; Chollar-Noreross-Savage shaft, 1598 feet; New Yellow Jacket shaft, 1513 feet; Old Yellow Jacket shaft, 1430 feet; angle of incline, 45°; Old Bullion shaft, 1766 feet; angle of incline, 41½°; Con. Imperial, 1732 feet; angle of ineline, 43½°; Crown Point, 1394 feet; angle of incline, 35°; Belcher shaft, 1449 feet; angle of incline, 33°; Overman shaft, 1201 feet; Forman shaft, about 1495 feet; Caledonia, 1153 feet; Alta, 1030 feet; Justice, 930 feet; pitch of incline, 40½°; Silver Hill, 757 feet; pitch of incline, 38°; Old Chollar-Potosi shaft, 1695 feet; pitch of incline, 45°; New York, 1059 feet; Baltimore, 1205 feet; pitch of incline, 38°. These measurements are from the surface of the ground at the top of the shafts.

Concentrates.

DENVER, COL., figures its population at 157,693.

WELLS, FARGO & Co. ceased carrying letters last Saturday.

THE Crizzly Mining Co. of Ruby Hill, Nev., will shortly resume operations.

THE Cumberland & Osceola Placer Miaing Co. (Nevada) will resume work about July 1st.

THE mill of the Gold Ring mine, in Green valley, near Dutch Flat, was burned last Monday. Loss $5,200.

JEFFERSON CLARK, a former Grass Valley resident, has a contract to electrically light Johanneshurg, South Africa.

S. J. MURPHY, working in the Hope mine, at Basin, Montana, was crushed to death last Sunday hy a mass of falling ore.

AT a meeting last week the miners of Willow Creek, Idaho, resolved not to allow saloons, Chinamen or sheep within the district.

NINETY-FIVE hydraulic mines are now in operatiou ia that portion of the State covered by the provisions of the Caminetti act.

THE Weber mine, at Lakeview, Idaho, of which Geueral R. A. Alger is president, is working a small force of men and running ten stamps.

THE $283,000 suit for damages brought by the Standard Cou. Mining Co. against the Bodie Con. M. Co. will he fought to a finish by the directors of the latter company.

A GREAT number of prospectors are said to be heading for the Grand Canyon of the Colorado, where some good prospects have been reported in that hitherto unexplored region.

THE Walter C. Hadley Company, of Denver, are agaiu reported to have hought the Mammoth gold mine, in Pinal county, thirty miles south of Casa Grande, Arizona, for $35,000.

THE Azusa, Cal., *Pomotropic* says the Glendora Milling Company has sold its interests in the Christie mine to Denver parties for $25,000. The Christie is an extension of the Rose mine.

NOTICES of mining locations are heginning to come iato the recorder's office at Whatcom, Wash., from the Slate creek district. It is reported that there are over 3000 people there already.

W. S. STRATTON, the Cripple Creek miner, has given $3000 to Mrs. Charles Clark, widow of the foreman of the Golden Eagle mine, who died last week. He also paid all funeral expenses.

THE Horsefly Hydraulic Company in Carihoo, B. C., is locally credited with an intention to "explode a mine of giant powder of 40,000 pounds to reduce the conglomerate so the monitor can handle it."

LAST Tuesday's Nevada *Transcript* strongly urges the miners of Nevada county, as a public duty, to contrihute that county's quota to the funds of the California State Miners' Association.

WM. H. BOLTNOFF, of Denver, was charged by Geo. F. Wheeler, a West Virginia capitalist, with "salting" two placer claims, and at the preliminary examiriation was honorably discharged.

THE Princess Mining Company has incorporated at Oroville; capital stock, $500,000. Directors—H. J. Milburn, G. H. Thomas, Detroit, Mich.; F. O. Goodwin, San Francisco; E. Harkness, J. Gale, Oroville.

IT is reported from Ensenada, Lower California, that Gen. Humphrey and H. E. Wood propose establishing a fifty-ton smelter near there, and that they will reopen the old San Fernando copper mine helow San Quintin.

AFTER five years of continuous working, the Arivaipa mines, Graham county, Ariz., have closed down. The workings have reached a depth of 580 feet and can be sunk no further with heavier machinery to handle the water.

THE *Inter-Mountain* says: "Though there are many idle men here, it is probably true that Butte is the most prosperous town in North America. It will produce this year 200,000,000 pounds of eopper, $5,000,000 in silver and $2,000,000 in gold."

INSTEAD of the usual military pageant, Sacramento will have a grand electrical display on the Fourth of July. The occasion will be made one of celebration over the introduction of a 4000-horse power electric current from the big American river dam near Folsom.

W. C. RALSTON, secretary of the State Miners' Association, delivered an interesting address last Saturday night before the Miners' Union at Grass Valley, urging the members to assist the State Association in their fight to protect mineral lands of the State.

A SPOKANE, WASH., dispatch of May 29th says: "The Kansas City Smelting Company purchased the Cliff mine at Trail Creek to-day, paying for it $110,000. A recent strike in the mine disclosed an ore vein eighteen feet in thickness, yielding assays of $78 in gold to the ton."

THE Weaverville, Trinity Co., *Journal* says: "The Bully-choop mine has been bonded to an Eastern syndicate for a period of ninety days for $500,000. If, at the expiration of the time, the syndicate decides to take the mine, one-third of the above amount is to be paid, the balance later."

THE cost of producing an ounce of fino gold from the Independence, Col., mine for the four months of this year has been $1.25; from the Victor, for over two years, $5.87; from the Portland mine, for the past nine months, $6; and for fourteen days in March last, from the Bogart claim, 95 cents.

IN 1891, says the *Review*, there were 13,000 miners engaged ia mining in Colorado. By midsummer of 1892 the number had been reduced to about 8000. Midsummer, 1894, saw about 6000 again employed, mostly, however, in leasing. In all probability the best obtainable records will show about 8000 engaged the coming summer.

THE Morning mine, in the Cœur d'Alenes, which was recently run on the co-operative system, has been leased by the Messrs. Longmaid, who commence work this week. They have investigated the property and concluded to pay $3.50 to all hands. It is thought that the Bunker Hill & Sullivan Company will come to the same conclusion sooner or later.

THE Redding *Democrat* has an advertisement of the S. P. Co.'s intentiou to apply for patent to certaia lands, of which the following are in Trinity Co.: Township 33 north, range 10 west, NE¼ of section 15; all of section 21; N½ SW¼ N½ of SE¼ and SW¼ of SE¼ of section 25; W½ of NE¼, NW¼ and SW¼ of section 27; all of section 33; township 38 north, range 8 west, E½ of section 21.

A NEW YORK dispatch of last Wednesday says that the petition for an order to show cause why the Western Nevada Miniag Company should uot be voluntarily dissolved was presented to Chief Justice Daily in the special term of the Supreme Court the previous day. The company was formed with a capital of $250,000 to purchase, work and develop certain mining claims in Esmeralda county, Nevada.

IT SEEMS, says the Colorado Springs *Gazette*, that there are two factions among the miners at Cripple Creek. The Cœur d'Alene men now number about 200, and they have run things with a high hand, but the old Colorado men don't care to be dictated to longer hy the Montana outfit. As a consequence there is bad blood and much feeling. The killing of Jack Smith and George Pohst, two of the Colorado division, has intensified it.

J. W. ARTHUR, vice-president of the Negro Creek Nickel and Copper Miniug Company of Leavenworth, Wash., says: "The deposits of nickel ore in the Negro Creek, Ingalls Creek and Ruby Creek districts is simply wonderful. Negotiations are now under way for the construction of a smelter somewhere near these mines for the treatment of this ore; and if we are successful—and present indications are favorable—there will he a mining hoom over there."

THERE is trouhle over the Magalia, Butte Co., mine. Years ago the shaft filled with water, but recently, at considerable outlay, a new shaft was sunk 300 feet, and, local reports assert, $100,000 was about to he invested in further development when a company of men "jumped" the ground and filed a location, under the name of the Trilby placer mine. Now, litigation and vexatious expense ensues—another instance of the necessity of securing a U. S. patent to a claim.

BECAUSE of alleged failure to comply with the requirement of paying the five per cent export duty on gold sent out of Mexico, the Mexican Government last week notified American placer miners at Juarez, a few miles south of the line, that they must buy the land occupied for mining purposes, at the rate of $250 per acre, or get out. Some have gone, and the remainder are undecided whether to leave their claims or fight. The matter seems susceptible of arhitration.

THE Col. North-Londonderry collapse has largely affected the promotion of mining companies in West Australia, for though it is certain that there were a score or more companies whose prospectuses were ready for publicatiou, it has in most cases been deemed advisable not to go to the public just yet. Of the seven companies who have done so, six refer to the Coolgardie district and the remaining one to the Murchison gold field, and a total capital of £759,000 has beeu asked for. In March the capital of the companies promoted was over one million sterling.

A WRITER in an Eastern contemporary furnishes statistics showing that the market price of chemically pure cyanide of potassium has fallen in eighteen years from $1.50 per pound to fifty cents, and concludes that this has had as much to do with the commercial success of the cyanide process as the invention itself. But that is like the man who drank because his wife had hysterics, the cause of the wife's hysterics being because her hushand drank. The invention is the cause of the demand, and the increased product by reason of this demand the cause of the decreased price.

BARON DE CHOISY, representing the Society of Industries, Mining and Sciences, of France, M. Bourgade, editor of the Paris *Matin*, and D. L. V. Browu, a mining engineer, have been examining mining properties in Amador and Nevada counties with a view to purchase, and have about closed a purchase on hehalf of French capitalists of a mining property near Grass Valley. Francc is investing considerahle at present in South African mines, but is not oblivious to the fact that California possesses solid attractions for profitable investment. French capital has recently gone into Shasta and Trinity counties.

REGARDING the Nevada Co. Electric Power Co.'s operation, A. Tregidgo is in Nevada City this week and has made arrangements for preliminary work. A contract has been placed for the plant. The *Union* says: "The capacity of this machinery will he 2500-horse power. Of this, 800-horse power will he developed with the least possible delay, and hy wire it will be transmitted to Grass Valley aad Nevada City, there to be employed for any purpose desired. It is expected that by the 1st of October, at furthest, electric power will he conducted into the two principal cities of the county from the site of the works, on the South Yuba river.

ONE DAY last week Alex. Budlum, who owns a block of stock of the Bullion-Beck (Utah) Co., nsked the secretary of the company to let him look at the books. The secretary declined, whereupon the San Francisco man gave him his choice—to show the books or go to jail. Sectiou 4691 of the Territorial Penal Code says: "Every officer or agent of any corporation having or keeping an office withia this Territory, who has in his custody or control any book, paper or document of such corporation, and who refuses to give to a stockholder or member of such corporation, lawfully demanding, during office hours, to inspect or take a copy of the same, or of any part thereof in a reasonnble opportuaity so to do, is guilty of a misdemeanor." The secretary didn't go to jail.

THE Bimetallic and Granite Mountaiu mines, at Granite, Montana, have closed down, throwing out of employment nearly 800 men. The properties are owned by St. Louis men, who give the low price of silver as the cause for the stoppage of work, claiming they have operated the mines at a less for some time. It is thought that the Combination, the only other mine near Granite, will be shut down, as the men have rejected a proposition to continue work at reduced wages. There has been a great deal of friction between the mining companies and the people of Granite for many years. The directors of the Bimetallic have decided that should work be again resumed, the mine will be drained through the big tunnel, which at present lacks but 200 feet of connecting with the workings of the mine. They believe that the water can he drawn off by means of a diamond drill, and thus save a large amount of money, which otherwise would have to he expended in keeping the mine dry during the shut-down.

IN the Bassick mine suit at Quiride, near Silver Cliff, in Custer county, Col., in the United States Court, Judge Riner has found for plaintiff, Joseph Staples, and held that the defendant, Dennis Ryan of St. Paul, now in possession was not entitled to hold the property. The mine formerly belonged to the Bassick Mining Company. The last year it was in operation it produced over $900,000. The stockholdors became involved in a row among themselves, and the result was that in 1887 the property was sold under executions. The plaintiff in the suit, James Staples, claimed the property under one judgment, and the defendant, Ryan, now in possessiou, under another judgment. Judge Riner's decision places the title in Staples' name. The mine is now under 1900 feet of water, and it is estimated that it will cost to put the property in operation hetween $100,000 and $150,000. The decision leaves the property still in the hands of Mr. Ryan upon bis filing a bond with the court, which will he done as soon as possible. The case will be appealed.

AT last Monday's meeting of the California Debris Commission a permit was granted Steele & Co., who have recently completed a restraining stone dam at their mine near Brownsville. On iaformation from Deputy United States Debris Commissioner W. W. Waggoner, who made recent personal examination, five hydraulic mines were ordered shut down. All of them are in Plumas county. They are the Mohawk, owned by S. Sorocco; the Garfield Flat, P. Rossi; the Grizzly Bear, L. Lorenzo; the Illinois, Messrs. Buckley & Hellman, La Porte, and the Holloway. Messrs. Gould & Speucer, Gibsonville. In the case of the latter, water and debris escaping through a tunnel to a stream near by was assigned as the cause for withdrawing the permit; at the Holloway mine the restraining dam was considered by the inspector insufficient; in the cases of the other three, leakage of the dams necessitated the closing of operations, in the judgment of the commission. Should the owners of the mines thus closed desire to resume it will be necessary to construct restraiuing works that shall he considered sufficiently strong by the commission and make re-application to resume, when, upon inspection, if satisfactorily reported upon, the permits in each case will he issued, uot as a renewal, but in the same form throughout as though issued for the first time.

Books Received.

"*Self-Culture*," The Werner Co., Chicago and New York. A large portion of this is devoted to "The Story of Human Progress." It starts with the proposition that instead of one great ice age there were six ice ages in primitive times; six different epochs of terribly Arctic cold over a great part of the globe, with incalculable accumulations of snow and ice, ice caps immensely broad and deep and heavy, and glaciers of vast reach and weight, under the effects of which, or in connection with which, continental areas sank below the waters of the seas and sea bottoms were raised far above sea level, alternating with tropical eons of time when fervid heat melted those ice caps and made all earth glow for ages. It also combats the Darwinian theory of ascent or descent, and argues that to accept his account of the origin of man denotes "limited comprehension and unlimited credulity." The idea of the author appears to be that man is developed from a variety of animal progenitors, each of the great races being developed from a race of anthropoid apes. The break in development from highest ape brain to the lowest human brain has never been satisfactorily explained. This author assumes that apes of higher development than any now living may have become extinct, which is an easy way to get around the question.

"*Manufacture of Tin Plate Abroad*" is a compendium of consular reports received from the Government Bureau of Statistics. It gives a more or less exact account of the mode of tin-plate manufacture in Austria, Belgium, Liege, Paris, Rheims, Berlin, Chemnitz, Dusseldorf, Bristol, Cardiff, Liverpool, Swansea and other European points. Those reports are always valuable, containing information accorded our official representatives, and transmitted, usually, in an impartial, unprejudiced way. The one before us makes clear the many difficulties that lie in the way of the American tin-plate manufacturer. The report of Lorin A. Lathrop, U. S. Consul at Bristol, England, is particularly interesting. He sends a report upon the tin-plate industry of South Wales, and says: "The answers, obtained with some difficulty, come from three independent sources. Though tersely expressed, they contain information that is usually guarded with the utmost jealousy." The facts and figures sent by Mr. Lathrop are comprehensive and evidently authentic, and the tables showing relative cost of production demonstrate that the item of wages of skilled workers is one of the great factors in the advantage possessed by the Cardiff manufacturers. Incidentally it is shown that while the exports of tin plate to the United States for the six months eading June 30, '93, aggregated in value $10,234,438, the exports for the corresponding six months of last year aggregated but $5,984,413.

Further Notes on the Gold Ores of California.

Written by H. W. TURNER.

Some brief notes were published in the *American Journal of Science* on the gold ores of California in June, 1894, and the following may be considered as an appendix to that article:

Gold in Barite.—During the past summer the writer examined some gold veins on Big Bend mountain, in Butte county, California, and found that one of them was of an unusual character. The vein is known as the Pinkstown ledge. It is located about a half-mile due south of the highest point of Big Bend mountain (Bidwell Bar atlas sheet). The ledge strikes N. 13° W. and dips at a high angle (about 80°). It is from two to three feet wide where best exposed at the north end, and is composed of a soft, heavy mineral, some of which is coarsely crystalline, with a granular structure, but most of it is finer grained with a schistose arrangement of the granules. No single crystals of the minerals were noted having a greater maximum diameter than five-eights of an inch. Some of them show plainly a characteristic cleavage. Dr. Hillebrand made a chemical examination of this soft mineral and reported it to be barite. Three sections of the barite were examined microscopically, and these show that when fresh there is scarcely any impurity in the mineral, and in fact no other substance was noted except scattered minute reddish opaque grains, which, as seen under the microscope, are reddish-yellow by reflected light, without metallic luster. They may be limonite. Many of the barite grains show distinct cleavages, which appear in the thin sections to intersect at nearly right angles. A tendency to a radical structure like that of epidote was noted at several points. The relief of the barite is rather high. A sample was examined for gold by Dr. Stokes, who reported that "the barite contains gold but too small in amount to be determined in the wet way." There is said, however, to be enough gold in the deposit to pay to work, and the writer understood that the owner of the ledge obtained gold from it by grinding up the ore in a hand mortar and panning it.

A considerable part of Big Bend mountain, as exposed along the road from the bridge over the west branch of the north fork of the Feather river to the abandoned village of Big Bend, is made up of clay slates, probably Paleozoic in age, with layers of greenstone schists, representing original angitic tuffs. The rocks along the east and south base of the mountain, as seen along the river (the north Fork of the Feather), are almost entirely greenstones, with one or two layers of sedimentary mica schists. These greenstones are largely amphibolitic rocks representing original surface lavas and tuffs, probably angitic porphyrites, but now containing little or no angite. The exact nature of the schist enclosing the barite vein was not determined. The south extension of the Pinkstown ledge, owned by Clarke, was examined, but no barite was found, the rock on the dump being a white, fine-grained schist, with a greasy feel. This, as seen in this section, is composed chiefly of minute, brightly polarizing fibers, perhaps talc, with numerous minute cubes of pyrite, arranged in rows.

Gold Associated with Talc Schists.—The magnesian rocks of the Sierra Nevada consist chiefly of serpentine and talc and chlorite schists. All of these rocks, together with some others of similar origin, are frequently found in the same area, the different varieties alternating rapidly in a perplexing manner. There are, however, especially in the area of the Bidwell Bar atlas sheet (Butte and Plumas counties), very considerable streaks of talc and chlorite schists with little or no serpentine. It has been noted by the writer that while quartz veins are very common in the talc-schist belts, they are very rare in the serpentine. Veins containing gold and forming pocket mines do exist in the serpentine areas, but in the two examples which the writer has himself seen there is talc schist directly associated with the vein, forming one or both walls.

One of the veins here referred to occurs on the Downieville sheet in Sierra county, on the spur north of Rock Creek and one and a half miles east of Goodyear's Bar. Here is a small quartz vein in serpentine with talc schist forming one wall. This vein had evidently been worked for gold, and the writer was informed that a gold pocket was found in it.

The other mine is in Mariposa county, on the Mariposa estate, and is in charge of Mr. Ludwig, who kindly showed me the deposit. There is here a streak of talc schist in serpentine near the west border of the large belt of that rock that extends from near Princeton to Mariposa, forming the high ridge just west of the latter town. The exact locality is one and three-fourths miles, a little south of east from Princeton. The deposit consists, besides the talc, of white dolomite, looking precisely like that associated with mariposite at the Josephine mine, near Bear Valley, pyrite and a black mineral, the latter occurring in plates with metallic surfaces in the dolomite. This black mineral was determined by Dr. W. F. Hillebrand to be titanic iron ore (ilmenite). The gold occurs native in the talc schist, and the pyrite and ilmenite are also saved for reduction. The writer's notes make no mention of quartz in this vein.

As stated above, the talc, chlorite and other associated schists form considerable belts in the area of the Bidwell Bar atlas sheet, and contain frequent quartz veins, as may well be seen at Quartz Hill, north of Lumpkin. The writer knows of no case, however, where one of these veins has proved to be large enough and to contain enough gold to warrant the erection of a quartz mill.

The rare occurrence of quartz veins in serpentine, a very basic magnesian rock, and their comparative abundance in talc rocks, which are much more acid, would seem to indicate a connection between quartz veins and the rock in which they form. But as both these rocks are altered forms of deep-seated igneous rocks, it does not follow that the silica of any particular quartz vein was leached out of the wall rock and re-deposited nearly in place. These igneous masses may extend to a great depth and the ascending hot waters and gases may have been in contact with rock like the wall rock for a long distance and for a considerable time.

As a matter of fact, quartz veins are more common in California in sedimentary rocks which are not presumed to extend deep into the earth's crust, than in igneous masses. The cause of this is more probably a physical than a chemical one, for fissures form more readily in sedimentary than in massive igneous rocks. It is extremely likely that the sedimentary series of the gold belt of California is underlain throughout by granite, and that this rock is the chief source of the silica of the quartz veins in the clay slates, and other associated rocks.

Serpentine being a rock in which fissures may be supposed to form with difficulty, it is by no means improbable that there is a physical as well as a chemical reason for the lack of quartz veins in that rock.

Mariposite.—The green micaceous mineral called mariposite by Silliman occurs abundantly at the Josephine mine, near Bear Valley. Several specimens of this were obtained in 1893, and submitted to Prof. F. W. Clarke for analysis. Thin sections of the material were made and these show that the mineral is micaceous, nearly colorless or slightly greenish with brilliant polarizing colors, resembling talc. There appears to be no perceptible pleochroism. The mineral is in the form of fibers and minute irregular foils with ragged edges, and extinguishes nearly or quite parallel to the longer axis of the fibers. Microscopically it is not all green, some of it being nearly white. Two analyses are appended by Dr. Hillebrand, one of the green, and the other of the white mineral.

Analyses of Mariposite. (438 Sierra Nevada Coll.)

	Green.	White.
SiO_2	55.35	56.79
TiO_2	.18	25.29
Al_2O_3	25.62	
Cr_2O_3	.18	none.
Fe_2O_3	.63	1.59
FeO	.92	
CaO	.07	.07
MgO	3.25	3 29
K_2O	9.29	8.92
$(Li\ Na)_2O$*	.12	.17‡
H_2O†	3.52	4.72
	100.13	100.84

* Very strong lithium reaction.
† No water given off below 300 C.
‡ Containing some K_2O.

The thin sections show that there is carbonate, probably chiefly dolomite mixed with the mariposite. This with some carbonate of iron was extracted with acetic acid followed by warm dilute HCl, the mariposite substance remaining unattacked. Dr. Hillebrand calls attention to the resemblance of the mineral in composition to pinite, and states that no definite formula is deducible. He determined the specific gravity of the green mineral to be 2.817 at 29.5° C. and that of the white mineral to be 2.787 at 28.5° C. The occurrence of chromium in the green variety and not in the white suggests that to be the cause of the green color. While resembling talc optically it will be noted that the chemical composition is very different.

Gold Quartz Veins in Tertiary Rocks.—Precious metal deposits in rocks of the tertiary period are not uncommon in the western United States. As notable examples of this may be mentioned the Comstock lode in Nevada in part at least in Tertiary lavas, and the gold and silver veins of the Bodie district in hornblende-andesite.* Silver deposits also occur in rhyolite in southern California.† But in the Sierra Nevada gold quartz veins in any but the Paleozoic or Jura-Trias rocks are rare. The occurrence of quartz with native gold in a rhyolite dike of Tertiary age in Plumas county has already been described.‡ The gold in the Silver Mountain district in Alpine county (Markleeville atlas sheet) is in chalcedonic quartz in Tertiary andesitic tuffs and the deposits of the Monitor district are likewise in Tertiary volcanic rocks. One of the ore specimens given the writer by Judge Arnot as coming from the last district is chalcedonic quartz containing gold. In both districts the rocks containing the deposits are much decomposed by solfataric action, and both are on the east slope of the range in the Great Basin drainage.

About one and a half miles south of La Grange in Stanislaus county (Sonora atlas sheet) in a flat-topped hill there are abundant veins of white quartz in clay which appears at first glance to be the basal portion of the Tertiary clastic series that caps the hill. Overlying the clay is a sandstone containing pebbles of white quartz and pearly scales of a hydrous silicate of alumina, which is very abundant in the Ione sandstone.§ The age of the sandstone is thought to be Miocene. Portions of the underlying clay are white in color, other portions stained pinkish in streaks and patches. When first visited, some years ago, the clay appeared to the writer to represent the lower clay of the Ione formation, which is well exposed at Ione and elsewhere, and as the quartz veins are unquestionably in the clay, it was then thought that the quartz veins were of Tertiary age. The quartz is the white, compact kind that occurs in the majority of the gold quartz veins, and not the chalcedonic quartz known to exist in veins in Tertiary rocks.

On a second visit to the locality, in 1894, good evidence was found that the clay is but the decomposed bedrock, which is here a quartz-porphyrite. Pebbles of the hardened clay were found in the lower part of the sandstone, and along some sharp contacts of the clay and overlying sandstone it was noted that the quartz veins stopped short at this contact. No quartz veins were found with certainty in the sandstone itself. Moreover some cracks in the clay, extending down from its upper surface, were filled with the material of the sandstone, showing that these cracks were in existence when the sandstone was being deposited and were filled in from above. At the head of a little gulch on the west side of the hill is a good exposure of the clay, with numerous quartz veins. The latter have a varying course, dipping mostly north at angles from 10° upward, some veins curving very noticeably in a vertical direction. In some of this much stained and discolored clay, porphyritic quartzes are to be seen, and as lower down in the gulch there is little altered quartz-porphyrite in place, there seems little question that the clay is a decomposed form of the same rock. At other points, notably on the east side of the hill, the white clay shows no evidence of its derivation from the bedrock, being of even texture throughout and without discoloration. Slickensided surfaces were noted in the clay at several points, along seams that intersect at varying angles.

Tetrahedrite.—This sulphide of copper and antimony has not often been noted by the writer in the gold ores of the Sierra Nevada. What appears to be this mineral, however, occurs very abundantly in the quartz veins of Mono Pass, east of the Yosemite Valley. The specimens (No. 455 S. N. collection) collected there by the writer from the Golden Crown ledge were examined by Prof. R. L. Packard, who reported that the sulphide is tetrahedrite or an allied mineral giving blowpipe reactions for sulphur, antimony, copper, lead and iron. The ore is presumed to contain silver and perhaps gold, but neither of these were determined.

Mr. W. Lindgren informs me that he has detected tetrahedrite at the following mines: The Boulder, Hathaway, Golden Stag and Pine Tree mines in the Ophir district in Placer county; the Osborne Hill mine at Grass Valley, Nevada county; and the Miller & Holmes, Knox & Boyle and Whiskey Hill mines in Tuolumne county, azurite being associated with the tetrahedrite in the last three mines.

Tioga Mining District.—This is situated to the northwest of Mono Pass, in the same body of schists that occurs in the Pass. Some specimens obtained there in 1866 by the writer from the Isbell claim, on Lee Vining creek, were assayed by Dr. W. H. Melville, with the following results:

No. 876 Sierra Nevada collection—

(*a*) Chiefly made up of zinc blende; contains 5 oz. gold and 7 oz. silver to the ton.

(*b*) Largely iron and copper pyrites; contains a trace of gold and nearly 16 oz. silver to the ton.

(*c*) Contains a large amount of arsenical pyrite, 51 oz. gold and 32 oz. silver to the ton.

The above samples probably do not represent an average of the ore and are merely given to show the association of minerals in the vein.

* This was first noted by Mr. W. Lindgren.

Keeping Everlastingly At It Brings Success.

Genius is really only the power of making continuous efforts. The line between failure and success is so fine that we scarcely know when we pass it—so fine that we are often on the line and do not know it. How many a man has thrown up his hands at a time when a little more effort, a little more patience would have achieved success. As the tide goes clear out, so it comes clear in. In business sometimes prospects may seem darkest when really they are on the turn. A little more persistence, a little more effort, and what seemed hopeless failure may turn to glorious success. There is no failure except in no longer trying. There is no defeat except from within, no really insurmountable barrier save our own inherent weakness of purpose.

Nature's Hydraulic Mining.

The Sacramento *Record-Union*, now that its associate, the *Bee*, has temporarily withdrawn active opposition to hydraulic mining, is engaged in an attempt to organize the people of the valleys into another crusade against those of the mountain counties.

The real problem of the Sacramento valley, says the El Dorado *Republican*, is not and never will be the discontinuance of hydraulic mining, for the fields that now remain accessible to that class of industry are becoming more and more limited every year, and they will ultimately become exhausted. The principal work of denuding the Sierras by mining has already been accomplished, and when every ravine and canyon in the gold-bearing region of the State was filled with miners, the amount of debris sent into the river systems was ten thousand times greater than it ever can be in the future.

The men and the newspapers that complain of the filling of the Sacramento valley by debris from the mountains are fighting against the law of gravitation and trying to prevent muddy water from running down hill. Ages in the past, as any observer can note in the topography of the Sacramento valley, it was an arm of the sea. Since that time it has been filled and converted into the finest farming lands of the State by the natural wearing down of the hills and mountains above it, the river channels filling in at one point, piling up the debris into a long tongue of sediment and then breaking its way to another depression till the lowest places are brought up to the general level. Thousands and thousands of acres of land in the valley have been filled in by this process and the bills of the mining counties worn down for hundreds of feet and torn into great canyons by these natural forces, unassisted by human effort, and yet the ranchers of the Sacramento valley and the people of the cities of Sacramento and Marysville attempt to shift the responsibility of God or Nature upon a few insignificant miners.

The rancher of the valley secures a piece of boggy land along one of the streams which ordinarily, under natural conditions, would draw from six inches to two feet of water in a wet season; he fences this land with mud levees to keep the stream away that is merely obeying the laws of Nature in trying to fill it, and thereafter he bowls against the miners for destroying his property.

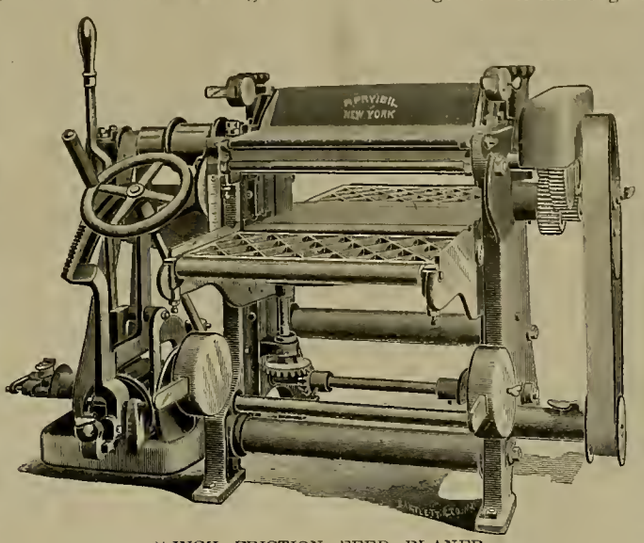
No matter what men and human laws and courts may do in relation to the Sacramento valley, no matter whether mining is continued or discontinued on the slopes of the Sierras, the laws of Nature will continue in force and the extremely low grounds surrounding every stream in the State will ultimately befilled whether men desire that result or not. If every miner in the mountains was driven out of the State and every human being was driven out of the mining counties, the wear and tear of floods would go on in the future as they have in the past, wearing down the hills and filling in the valleys. There is no way in which man can prevent this result, so long as rain continues to fall and rivers to flow. Already the debris sent down from the cultivation of land in the foothills is greater in most counties than the silt from hydraulic mining. Every piece of plowed land washes in spite of all the hill rancher's care, and his best soil is virtually stolen from him by natural agencies and taken to the valleys, to build them into farms for other men. Are these foothill ranchers to be prevented from plowing their ground because this act makes mud that troubles the valley people? Each rancher does only a small damage, but in the aggregate it is far greater than what is inflicted by the miners, for every bit of cultivated soil sends its muddy stream in winter.

There is a broader and a higher conception of the debris question than has yet been reached by the advocates of either of the conflicting interests, and it is that man may assist the powerful forces of Nature, but he cannot operate in direct conflict with them. If the National or the State Government, or both united, can devise plans for diverting debris from the mountains into the tule beds of the valley, so as to complete the natural process, well and good; but if that cannot be done, the people may expect to raise levees higher and higher and to live constantly under greater danger, for, no matter whether mining ceases or not, the debris will continue to come down.

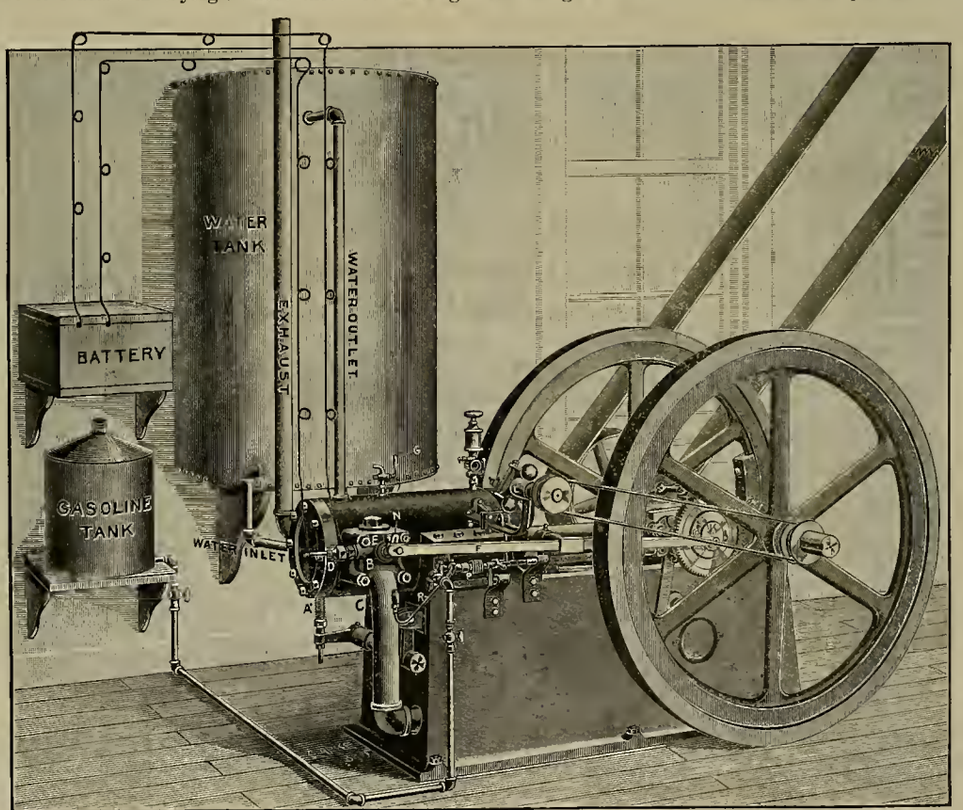
24-Inch Friction Feed Planer.

The accompanying cut portrays a planer with a friction feed, whereby the operator can lessen the feed to one-third of the regular or increase it one-half when common work is to be rushed through the machine.

He can also feed back again in case a larger or smaller cut is wanted. The change can be made instantly without changing belts, and is considered of great value when taking extremely heavy cuts or when planing parquet flooring or any other work where more or less against the grain has to be planed. Floor space, five feet six inches by four feet eight inches.



24-INCH FRICTION FEED PLANER.



THE FOOS GAS AND GASOLINE ENGINE.

The Foos Gas and Gasoline Engine.

The use of gasoline engines as an economical form of power, in situations whose demands are in the range of the capacity of these engines, is constantly increasing. San Francisco manufacturers are producing a superior type of engine and the large number of orders show the favor with which this form of motor is received. The Foos Gas and Gasoline Engine Co., of Springfield, Ohio, also lay claim to many points of merit, and an illustration and description of their engine is of practical interest, the points of similarity and difference being readily recognizable. The charge of gas or gasoline is ignited by a small electric battery. The engine, it is claimed, will run for months without any cleaning or other care than oiling bearings, filling oil cups and seeing that the electric battery is in good working condition.

The illustration presented herewith has the parts lettered as follows: *A*, exhaust pipe, exhaust chamber and exhaust valve; *B*, exploding chamber; *C*, inlet valve in exploding chamber; *D*, stationary electrode; *E*, revolving electrode; *N*, spring crank; *F*, rod which gives revolving motion to electrode *E*; *R*, brass pipe conveying gasoline from pump *P* to mixing pipe *M*; *G*, stop cock for escape of compressed gas; *K*, crank disk for regulating time of explosion of gas in exploding chamber *B*; *L*, governor; *M*, mixing pipe for admission of pure air; *P*, gasoline pump. The motive power is secured by drawing pure air into the pipe *M* and there mixing it with a few drops of gasoline thrown into this pipe by the pump at every other revolution of the fly-wheel. It is thence drawn by the suction of the piston in its outward movement into the cylinder through the exploding chamber *B*. The explosive gas thus formed is compressed by the return movement of the piston and then exploded by an electric spark. The cylinder is surrounded by a water jacket in which soft water is used. Connecting with the exploding chamber is the inlet valve *C*, which is opened and closed at every alternate revolution.

The spark in the exploding chamber is produced by the connection and separation of the inner points of the electrodes *D* and *E*. These points come together at every revolution of *E*. The electrode *D* is made to screw further in, so that when the inside end is worn off it can still be kept in contact with the end of *E*.

The governor *L* is particularly sensitive. If the engine runs too fast the acorn-headed screw at the end of the shaft can be turned in, and if the motion is too slow the screw may be withdrawn. The speed may also be controlled by compressing or loosening the governor springs by means of the nuts at the ends.

Two of the distinctive features of the Foos gas engine are its patented electrodes and governor. They use one revolving and one stationary electrode, the revolving one wiping the point of the stationary electrode. This keeps the points always bright, insuring a good electric spark, permitting the starting of the engine in a few seconds. These electrodes, in connection with the sensitive governor, enable them to furnish an engine that will give a steady, unvarying speed suitable for running electric light plants or any other machinery requiring steady speed.

In his famous speech on conciliation with America, Burke uttered a text which each of us may profitably ponder: "All government, indeed every human benefit and enjoyment, every virtue and every prudent act, is founded on compromise and barter. We balance inconveniences; we give and take; we remit some rights that we may enjoy others." These few lines epitomize all human action. Whatever be our occupations and ambitions, it is impossible to progress with our cherished undertakings until we realize that, of all the necessities of social or industrial life, none is greater than the spirit of mutual compromise.

With steel unprotected and exposed to the action of the weather and sea water, corrosion is said to go on at the rate of 1 inch in 82 years, while with iron the rate is 1 inch in 190 years. Exposed to the weather and fresh water, these periods are increased to 1 inch in 170 years and 1 inch in 630 years, respectively. When kept completely immersed in sea water the rate is said to be 1 inch in 130 years for steel, and 1 inch in 310 years for iron.

Mineral Land in Northern California.

TO THE EDITOR:—The United States Land Department seems to be trying to classify mineral and agricultural lands by the smallest legal subdivision. After critically examining each subdivision, if no paying mines are found it is called agricultural land, whether it can be used as such or not, and this is done in well-known mining sections.

The two kinds of land should be divided in this way: All land suitable for agricultural purposes, whether mineral in character or not, should be classified as agricultural land. All land mineral in character and not suitable for agricultural uses should be classified mineral land, even though it does not show mineral in paying quantities, if situated in a well-known mining region. There is a very small amount of land in California mineral in character, and yet suitable for agricultural purposes.

The labor of a commission one year would classify all the land in California, if done in this way, and with little dissatisfaction except to those who are trying to patent mineral as agricultural land.

To allow this gold-bearing land to be controlled by a monopoly would be a crime scarcely equaled by the demonetization of silver. Prospecting would cease, for no one would care to be subject to arrest for trespass. When prospecting stops gold mining ceases.

In a letter from a high official of the Southern Pacific Railroad Co. to a land agent at Portland, Oregon, he says a reputable citizen, who at one time occupied a position on the bench, forwarded to the land department an affidavit declaring that all land north of Township 32 north in the State of California was mineral land. He said that if the Goverument pay heed to such affidavits large areas of agricultural land would remain in its primitive state. The writer filed that complaint (but never occupied a position on the bench), and it was true, but was dismissed by the Commissioner of the Land Office for the reason that there were non-mineral affidavits on file in this office on the land. There are affidavits on file in the Land Office at Washington that there is no mining land north of Township 32 north in California, and the Commissioner believes them.

The miners of this State would like to know who filed those non-mineral affidavits, but have not yet succeeded in finding out. The writer has made over nine thousand gold and silver assays, and has shipped nearly five hundred thousand dollars' worth of gold ores to smelters from this land since 1886.

While there is not a paying mine in all of the smallest legal subdivisions it is well known mineral land, and not an acre should be patented to the railroad company, except some timber land on the east side of the Sacramento river. This same official says there are mining companies in this State holding under the placer mining laws from one to three thousand acres for the timber only. There is also a railroad company trying to patent over two thousand square miles in Northern California that, by the terms of their land grant, and a decision of the Supreme Court of the United States, and the character of the land, they are not entitled to—not an acre of it. If the land could be examined by a commission, or the miner allowed to prove its character other than by the absurd and impossible way, the smallest legal subdivisions, the railroad would get no patent to this land.

If this is not mineral land under the decision of the Supreme Court, there is none.

One would suppose from this official's letter that a prospector was a marauder that went about the country breaking into private enclosures without let or hindrance, and the best way to suppress him would be to turn the mineral land over to the railroad company. He says he knows of no law that would allow anyone to prospect on company land, which is quite true. It would stop this (as he would have the people believe) enemy of the farmer.

The output of gold and silver for Shasta, Siskiyou and Trinity counties was $2,532,529.78 for 1893. The output of these counties is increasing, and will continue to do so, unless the Government patents the odd sections to the railroad company. An examination of this land will show that there are not forty acres in one body of agricultural land not already taken. The little there is has almost all been patented years ago. But if there must be a paying mine on every twenty acres, on odd sections, before the miner can hold it, it certainly was not the intent of Congress to exempt mineral land to the extent of twenty acres only for each paying mine. There are many townships that were advertised for patent by the Redding land office where "one might as well look for birds in the sea or fish in the air" as to look for agricultural land. It appears to be a scheme of the United States land department and the railroad company to compel a miner to prospect his land judicially, and in small quantities at a time. This, no doubt, will be as expensive as running tunnels or sinking shafts, but hardly so effective.

To prove the existence of soil suitable for farming on top is more easily done than to prove the existence of mineral below the surface. The agricultural character of the land is entirely ignored in this judicial prospecting, and the miner is called upon to prove an impossibility, namely, mineral in paying quantities in each and every one of the smallest legal subdivisions. To compel a miner to contend against an imaginary agricultural value when none exists is neither law nor common sense. J. E. BELL.

Shasta, Cal., May 28th, 1895.

Cripple Creek's Fine Native Gold.

TO THE EDITOR:—In your issue of April 20th there was an article copied from the Grass Valley *Tidings* of April 10th, stating that there had been 6.37 ounces of gold dug from the ground near Rough and Ready, which had been sent to the mint at San Francisco in the form of amalgamated cakes and showing a fineness of 992¼, and that the report showed the entire absence of silver, a circumstance so rare as to deserve prominent mention, and that it was believed that the Rough and Ready could go on record as a producer of the purest gold dug from the ground.

I wish to state, and I believe that you are ready to receive all such information for publication in your valuable journal, that through the courtesy of the U. S. mint officials of this city, William J. Puckett, assayer in charge, I have been permitted to examine the books and I find therein that upon March 14, 1893, there was deposited 134 oz. of gold from Cripple Creek, Colorado, that went 999 fine; no silver. May 11, 1893, 48 oz., 999 fine; June 19, 6 oz., August 29, 17 oz., March 5, 1894, 19 oz., 999 fine; different depositors. And, besides these, I find that on August 15, 29 oz. showed a fineness of 996; no silver. September 5, 30 oz., 996 fine; no silver. November 1, 3 oz., 997 fine; January 20, 1894, 5 oz., 997 fine; February 9, 1894, 7 oz., 997 fine, and March 19, 19 oz, 996 fine. I also find recorded therein seven other entries, all deposits made from Cripple Creek, ranging from 993¼ to 995½ in fineness—from March 1, 1893, to March 1, 1894. All these deposits were from the Cripple Creek gold camp, El Paso county, Colorado. The names of the depositors are to be found upon the hooks of the United States mint and are withheld from mention in this article at the request of the mint officials.

Cripple Creek is on record as the producer of the finest native gold in the world. The most of this gold that is found so fine in nature is in the form of cubes, and I believe very rare. I have in my office some specimens of same gold which will be on exhibition at the Mining and Industrial Exhibition to be held in this city in 1896. The placer gold of Cripple Creek is worth $20 an ounce, upon an average. The placer gold of Park county, Colorado, in the Tarryall district, is worth, upon an average, $19.90 an ounce. Respectfully yours, THOMAS B. EVERETT.

Denver, Colo., May 22, 1895.

South African American Exhibition.

Under date of April 4th, I. F. Webner writes from Cape Town, South Africa, as follows:

"Several South African merchants, American and otherwise, together with our local consul, have discussed the idea of an American exhibition to be held in South Africa during November, 1896 (our spring, your fall), at some city to be subsequently decided upon. The enormous strides made by this country during the last few years have been most remarkable, and such a scheme, if properly worked out, would form an unrivalled advertisement which would be noticed by the whole of South Africa, and not confined to any one place; and as this is pre-eminently the land of the future, it is well worthy of your attention. On behalf of the Provisional Committee, I should be pleased to supply you with any statistics or information generally as to the country's resources and trade, and arrangements would be made for a special low freight rate.

"Before submitting a draft prospectus, the feeling of manufacturers and merchants in America towards such a project is being tested, and I trust to hear favorably from you."

The secretary's address is Box 429, Cape Town, S. A. The matter is worthy of local attention.

Where Wampum Is Still Used.

"A small part of the commerce of the world is still carried on by the use of shells as a medium of exchange," says E. G. Woodcraft, a New York broker. "The Portuguese found this sort of money in use by the natives of the eastern coast of Africa when they opened up trade in that region, and have found it to their advantage to continue the practice. Fortunes are said to have been made by collecting the shells on one part of the African coast and putting them in circulation at a point only a few hundred miles away. These shells are sold by weight. The price varies according as the supply compares with the demand. Prices have been known to double and even treble within a few months. The prices also vary greatly within short distances. What has cost the merchant from 50 cents to $1 in the market, will often bring him $7 or $8 worth of goods in another market."

Coast Industrial Notes.

—The new $60,000 crane at Mare Island has been satisfactorily tested.

—Oregon expects to sell 100,000 bales of hops this year. Last year's crop was 65,000 bales.

—W. E. Henry has sued the city of Sacramento to recover $563,285 for alleged violation of a contract to supply the city with clear water.

—A separate receiver has been appointed for the Colorado Midland railway, although its capital stock is owned by the Atchison, Topeka & Santa Fe.

—The Amoor River Co., of Siberia, are having built twenty-two 500-ton steel barges. Half the number have been contracted for at the Union Iron Works.

—The Panama R. R. Co. has a contract with four additional steamers to ply between Panama and San Francisco, stopping regularly at Mexican and Central American ports.

—J. Van Buskirk, of Michigan, has bought 20,000 acres of sugar pine in Calaveras Co., and has a force of men clearing out the Mokelumne to float the logs to a point where they will be sawed.

—The Girard Water Wheel Company is building a 200-horse power plant for the Light and Power Company of Ontario, Cal., and has shipped a 20 H. P. plant to the North Star Mining Company, Grass Valley.

—Nearly $100,000 will be expended this summer by the Market Street Railway Co. of this city in the improvement and extension of the Ellis and O'Farrell street electric lines, including twenty-four new cars, costing $72,000.

—An Anglo-Canadian syndicate is about to purchase a number of wooden sailing vessels in England, with a view to establish in British Columbia and along Puget sound a local lumber fleet. The vessels will be of moderate size, ranging from 600 to 1000 tons register.

—Boise City, Idaho, reports that the long-talked-of railroad from Butte, Mont., to Reno, via Boise City, will soon be built. H. H. Daniels, representing Philadelphia and New York capitalists, is making final arrangements. The business men of Boise City will put up the required $100,000 bonus.

—The Santa Fe & Cochiti R. R. Co. has incorporated to build a railway from Santa Fe, N. M., along the Santa Fe river to Agua Fria, and thence via Allerton and Bland to Rio Grande. Capital stock, $250,000; incorporators, A. H. Handlan, T. M. Murray, L. Ellis, J. H. Purdy and H Claussen.

—The McCormick Mower and Reaper Company, of Chicago, and Enrique Creel, of Chihuahua, have been granted a concession for the construction of a railroad from Chihuahua to the Ocampo mining district. The Government will give a cash subsidy of $8000 per mile. Preliminary surveys have been made.

—By a cut-off from Wenatchee to Cle-Elum the Great Northern can utilize the Stampede tunnel and save building its own $3,000,000 affair. The Tacoma *Ledger* thinks that this is "something Mr. Hill seems to have had in contemplation for some time past, as it is now reported that he has acquired considerable interests in the Roslyn coal deposits.

—J. J. Hill, of the Great Northern, emphatically says: "The Northern Pacific will be reorganized by its bondholders. This is a big job, and will undoubtedly take some time. It cannot be done in a hurry. When it is reorganized it will be handled by its shareholders, and you can depend upon it that there will be no consolidation with the Great Northern—never."

—About $3,000,000 is invested in Alaska salmon canneries, which put up $2,000,000 worth of canned salmon annually. The same destructive measures that so nearly exterminated the Columbia river salmon threaten to gouge the eyes out of the Alaska business also. The Government should stop the Alaska salmon slaughter at least, even if unable to stop the rapid extermination of the seal.

—Two daily newspapers have put in type-setting machines, which bear the same relation to setting type by hand that a header wagon does to a scythe. The latest achievement in swift newspaper work is to dispense entirely with the type-setter, the type-writing machine, and manuscript or "copy," and set the news direct from the wire or telephone with the linotype, which has a capacity of thirty words per minute.

—The directors of the S. F. & S. J. V. R. R. have finally secured satisfactory settlement of the China Basin lease with the city Harbor Commissioners. At last Tuesday's meeting the whole matter was formally arranged. A contract for 300,000 redwood ties was made with L. E. White & Co. at twenty-eight cents each. There were thirty-five bids, the highest bids being 47¾ cents for Port Orford pine and 40 cents for redwood. The entire amount must be furnished by May 1st, '96.

—H. P. Wood, the Hawaiian consul at San Diego, received an order from the commissioner of agriculture and forestry of Hawaii for 500 horned toads, to be used on the islands to destroy a bug that is eating everything in sight. The commissioner wrote that a lot of toads had been imported, but that they required water, which was not always handy, while the horned toad needs no water and is equally expert as a bug catcher. Consul Wood has advertised for horned toads, offering to pay $1 a dozen for them.

—Judge Goodwin, in the Salt Lake *Tribune*, says: "San Diego wants railroad connection with Salt Lake; so does Los Angeles; so, we believe, does Santa Barbara; so, we know, does San Francisco. If one of either of five men whom we know in this city had the nerve to use a little of his own money and to go East, he could secure the sale of bonds enough at $15,000 per mile to build the road. He could build the road for $12,000 per mile, and with it finished he could own the road, all the stock of the road, and have $200,000 in his pocket, and he could in five years pay off all the indebtedness and then own in his own right a property which would be worth at least $25,000,000. At the same time he could double all his property interests in Salt Lake City. It may be asked how we know this, and our answer is, because the freight on the coal alone for the Southern Pacific, the Atchison, Topeka & Santa Fe and the city of Los Angeles would pay all the operating expenses and fixed charges of the road, leaving the freight on ores, the merchandise freight, the passenger freight, the mails and express clear profit. We said five years to clear up the debt. We believe it would not require over three, and the only very moderate charges need be made to do that. The writer of this once showed how, at one-half the rates charged by the stage companies and express and freight companies, a road between Eureka, Nev., and Palisade would pay for itself, all the money back, in two and one-half years. The first million expended in building the road was thrown away, but when the road was finally put through all the money and all the interest was paid back in fifteen months. The road between here and Los Angeles would be a good speculation if there were no mines on the way, just the coal to carry out, and the passenger trade would be enough to pay the interest on the cost and large dividends. But when we consider the number of mines that would have to be supplied, and the amount of ore that would have to be moved, it makes the building of that road the very finest investment that can be found in the West."

Scientific Progress.

Argon.

It is the general opinion that Lord Rayleigh will get the $10,000 prize offered by the Smithsonian Institution from the fund given in 1891 to that institution by Thomas G. Hodgkins of New York, to be devoted "to the increase and diffusion of more exact knowledge in regard to the nature and properties of atmospheric air, in connection with the welfare of man."

Argon has a name, given by its discoverer, which means "no work." It can't be made, by the utmost ingenuity of the chemical manipulators, to do anything. They have tried every conceivable means of making it give some sign of stir, motion, or potential energy, but without avail. There is but little of it; it is good for nothing, a mere tramp element, or perhaps compound, for nobody can find out what it is, not even to make a good guess; and all the noise about the discovery is due to the fine work done in getting to know the naked fact of its existence, and, so far, its uselessness and worthlessness. The fine work, however, has been exaggerated. It was made comparatively easy by starting from the very plain fact that nitrogen in the air is heavier than nitrogen obtained chemically. It was easy to argue that there must be a little of something else of greater weight in the nitrogen of the air. On this sure basis some very fine work was done, simple enough in theory, along either of two lines, and not so difficult. The stuff is so inert, inactive, so thoroughly dead in all its relations that measures for making the true nitrogen unite with anything will give the false as a residue. The difficulties are thus easy difficulties, and creditable as the work may be it cuts no figure at all by the side of the real great discoveries made by Faraday when he held the position at the Royal Institution in London which Tyndall held after him, and which Lord Rayleigh now holds. The enthusiasm over the discovery is for the most part a generous compliment to men of very great distinction who have conducted the research. And the suggestion of letting the Hodgkins fund prize of $10,000 go to Lord Rayleigh cannot be acted upon except by wrong of the most manifest character. "In connection with the welfare of man" is the broad fundamental condition of the fund, and argon has no more met that condition than a study of the man in the moon would meet it. The use of a single dollar of the Hodgkins money on account of Lord Rayleigh's interesting but absolutely valueless research would be as much a wrong to the fund as the use of it in aid of Secretary Langley's extremely interesting and brilliant, perhaps even hopeful, flying-machine experiments. In one of the elaborate treatises sent in upon the offer of the Hodgkins prize, it is very fully shown how ignorantly chemistry has misunderstood the character of nitrogen, because of its occurrence in such explosives as nitro-glycerine, when the fact is that the part played by the nitrogen is that of its inertness, its feeble chemical hold on the oxygen, to the energy of which, and to that alone, the violence of the explosive is due. In the light of correct knowledge of nitrogen by far the best guess that can be made in regard to argon is that it is three-atom oxygen: not made in the laboratory of our atmosphere, perhaps, but the heir of the ages of cosmic fire, when were finished some things which defy the meddling hand of man.

Mr. Edison has said of argon, that its discovery is a fresh evidence of how little we know of the atmosphere, and that he thinks it probable that further experiments will disclose other new elements in the air. But it must be remembered that argon, the amount of which in the air is estimated to be a hundred and twentieth part of the whole, has gone along with nitrogen, as ozone with oxygen; and that mere discovery of the existence of minor elements that play no active part amounts to very little. The new knowledge needed is knowledge of the parts played by the known elements.

When a rifle gun comes from the arsenal, it is coated with grease to prevent rusting during transit, and this coating is kept on until the gun has been lifted into its carriage. The grease is then removed by washing the gun with a strong solution of potash. It is washed twice and allowed to dry thoroughly. The gun is then a glistening silver tube. The next operation, and one requiring more care, is the application of a mixture of sulphate of copper dissolved in sweet spirits of niter. To an ounce of each is added a pint of distilled water. Four coats of this are applied, rubbed down hard, and allowed to dry for twenty-four hours. Under this treatment the gun is transformed into a warm reddish-brown without gloss. By adding arsenic to the same solution, and applying again, the gun assumes a darker tone. Now comes the hardest part of the work—the polishing. Boiled oil is mixed with beeswax and turpentine until comparatively thick. This is rubbed in with cotton rags at first, and then with the palm of the hand, the result being a mahogany brown tint. The brown coat lasts remarkably well unless the gun be fired, when the heat of the discharge seriously damages the polish. The last coat is replenished about every month. There is also a process of treatment given to the gun carriages of the new crack cruisers. These carriages are cast, and it is a difficult matter to make white paint adhere to them. To obviate this, the carriages are covered with a thin layer of cement, which is polished with trowels until it is like glass, and the white paint is then applied to the smooth surface.

Indefinite penetration toward the center of the earth is prevented by the increasing heat encountered, but a scheme has been made public by which it may be possible to explore farther than hitherto. The method is to sink first a shaft as far as the temperature will permit, then a pipe reaching from top to bottom is built in, down which is forced a blast of cold air which, it is thought, will effect the requisite cooling if continued for some time. The pipe is lengthened piece by piece as the deepening proceeds. An exhaust pipe should also be provided, and the shaft walls, when not air tight, should be so made so by a sheathing of metal plates or other coating. As the shaft is made deeper the heat increases and consequently a stronger blast is required. At a certain depth air must be pumped from the bottom in order to render the pressure endurable to men. In spite of all these precautions the deepening will be finally prevented by conditions existing in the earth itself; for example, accumulations of gases.—Deutsch Bauztg.

The weight of one hundred cubic feet of natural gas is 4287 pounds, composed of 1072 pounds of hydrogen and 3215 pounds of carbon, and requires for its perfect combustion 969.3 cubic feet of air, weighing 74,561 pounds. It makes, in burning, 9648 pounds of steam and 11,788 pounds of carbonic acid, equal to one hundred, and produces 94,593 heat units when the steam is not condensed, the total products of combustion being, therefore: Steam, 9648 pounds; carbonic acid, 11,788; nitrogen, 57,412; or a total of 78,848 pounds. If these products of combustion escape at a temperature of 600°, they carry off with them 12,712 heat units, or about 14% of all the heat produced by the fire; or if they escape at 300°, they carry off less than 7%. If, however, for any reason, twice as much air as is necessary to combustion passes through the fire and escapes up the chimney along with these products of combustion, there would then, at a temperature of 600°, be a loss of heat units equal to about 26% of all the heat produced by the fire.

The most probable mean density of the earth is 5.66, that is, the earth has 5 66 times the mass of an equal volume of water.

Mechanical Progress.

Some Unnecessary Objections.

In discussing the papers upon electric transmission of power that were recently read at a meeting of cotton manufacturers, some of the points brought out in objection to this method seem trivial. One was the fear of lightning and its effect upon the system. The manner in which this was stated would lead to the presumption that dealing with electricity was something new and untried. This matter of lightning is just as serious in the running of a large street-railway or street-lighting plant as in running a mill, yet it appears to have been very satisfactorily settled for those purposes. Objections to the use of electricity must be based upon better grounds than that.

Another objection suggested was that the life of the motors and generators would be very short, and the depreciation and renewals account, therefore, very large. There is really nothing about a motor or generator that is complicated, or which will give out quickly with proper care any more than there is with an engine. One frequently hears of motors giving out at some point, short circuiting or burning out the armature, and likewise we hear of engine piston heads being blown out, of pistons cracking, of crosshead straps breaking and wrecking the engine. Yet no one would have the temerity to suggest that because of this we should abandon the use of the steam engine. Nor should occasional breakdowns be advanced as a reason why motors should not be used. As now made, motors and generators are long-lived, and with proper care will last as long as any other machine. The trouble heretofore has been that the machines have given the impression of an ability to take care of themselves, and are allowed to do so, and trouble results, or the other extreme is tried and ignorant handling has produced a similar result. With intelligent care, motors or generators need not be expensive.

Steam Pipes for Ocean Vessels.

Copper is the material usually employed for making the big pipes which conduct steam from boiler to engine on steamships. By reason of its ductility that metal is admirably adapted to the necessary, though slight, changes in shape resulting from heating and vibration. But with the higher pressures now carried greater thickness is required. Hence a copper steampipe must lose the advantage of bending readily, and its strength will become more uncertain. The customary method of manufacture is to cut up sheets into strips and braze or solder the edges. But the difficulties of making a tight join increase with the thickness of the material, consequently there is now a tendency among marine engineers toward the substitution of iron or steel for copper in this part of a vessel's fittings, especially since it is now considered doubtful whether the last-mentioned metal is, as was formerly supposed, less liable to corrosion than the others.

There is some diversity of opinion, however, as to the best material to use in place of copper. Bends and tees for joints can more readily be made in cast iron than in wrought iron or steel, but the former is much heavier than either of the latter in proportion to their strength. Iron and steel can be drawn out into seamless pipes, but to this process is offered the objection that an undiscoverable flaw in the ingot may develop weakness in the product, whereas copper sheets, such as are used for steam pipes, may be examined for defects on both surfaces. Lap-welded pipes are now made of both iron and steel. Some claim that the latter are much the strongest, and present data to corroborate their assertions. To be sure, lap-welded steel pipes often have a butt-strap riveted along over the weld, as if less confidence were felt in the security of the joint than in that of an iron pipe of the same construction. It is intimated, however, that not only is this precaution needless, but that it actually weakens the pipe. In a recent discussion by experts of a paper read before the Institution of Naval Architects of Great Britain, the preponderance of opinion appeared to be in favor of using steel.

Keep on the Right Track.

To the machinist laboring industriously all day at the bench, the engineer wielding the shovel or sitting in his cab Argus-like looking for signals, and the general mechanic going about his usually arduous duties, it is a potent cause of discontent to see men of kindred origin suddenly rise to wealth and apparent honor by some master stroke, or a succession of such strokes. The career of the mouse-trap peddler and tanner has an evil influence. It is seen that he succeeded by his genius for plunder, his ruthless wrecking of interests entrusted to him and his perfidy in every instance where he could gain by such a course. There are in America a great many parallel examples, only less conspicuous and notorious. The fact that these men generally escape punishment and appear to have been very smart in defying the statutes and the unwritten laws of every-day honor is a powerful incentive to emulate them.

But we do not believe, says the *Scientific Machinist*, that any kind of success dishonorably won proves to be a real satisfaction. How much grander, how much safer to emulate the industry, the courage, the unswerving integrity which enabled our noted engineers and inventors to make for themselves a great name and to confer lasting benefits upon society. No man should be seduced from the path of prudence and rectitude by the sharks who have become enriched without giving value received, who have torn down and deprived, not built up nor caused increment of good to any.

How Steam Pipes Start Fires.

Neither ordinary live steam nor "superheated" steam will heat a pipe thick and strong enough to convey it to a degree sufficient to produce a fire on wood, however dry. It will not even set charcoal aglow or in a blaze. But dry charcoal, when the heat is removed from it, being nearly pure carbon, will absorb oxygen from the air under favorable conditions so rapidly as to produce active combustion—that is, a glow or a blaze. The process of the origin of a fire from a steam pipe is: The heat from a steam pipe will, in course of time, char, or, as the chemists say, carbonize, wood in contact or close to it. When this charring process extends to any depth in the wood it presents a surface full of fissures and cracks, thus exposing a large section to the air. This process of charring drives the oxygen out of the charred portion, and keeps it out while the heat is kept up. When the heat is removed the charcoal reabsorbs oxygen from the air, and if the action is rapid enough in a dry atmosphere combustion is the result. This explains why fires in steam plants and buildings heated by steam, that originated from steam pipes, always occur after the pipes have cooled, generally during the night.

Interest in vertical engines for large powers seems to be attracting considerable attention. The use of vertical engines for stationary work is very common in England and the continent, not because of any very intrinsic merits of the design over the horizontal type, but because of the influence of marine practice upon English stationary practice. In England there are so many large and powerful builders of marine engines that in some manner the influence of their work dominates the efforts of others in the marine line, and when one of these builders makes an engine for stationary work, it is almost always, and quite naturally, very nearly the marine type.

Electrical Progress.

The Electric Locomotive in Railroading.

In the opinion of many experts, the time when the electric locomotive will take the place of the steam locomotive for all kinds of railroad work is much nearer than has generally heen imagined. In support of this helief William Baxter, Jr., points out that no engineer of any prominence would have veutured to say, three or four years ago, that at the present time the electric motor would he making such inroads into the legitimate field of the steam locomotive as it really is making to-day. Mr. Baxter maintains that the ahility of electricity to compete with steam has always heen underestimated. The main reason for this is that ahout the only direction in which competition was considered possihle was in the matter of coal consumption, whereas "railroad men, whether engaged in operating steam or electric roads, know that the coal hill is only one of the items in the cost of operation, and that it does not constitute such a large portion of the total expenditure as to make it possihle for even a very great reduction in this direction to determine the superiority of one system over the other." Mr. Baxter summarizes the principal advantages of the electric motor as follows: First, The cost of repairs is less with electric than with steam locomotives. The mechanism is far more simple; there are not so many moving parts, and these parts are not so much exposed to the action of mud, sand, water, etc. In the second place, the miles run per day, or in other words, the hours of service ohtained per day, are less with steam than with electric traction. Consequently the cost of labor per mile run is much greater and the amount of work done with a given sum invested in locomotives is less than with motors. Locomotives running at an average speed of thirty or forty miles an hour do not make any more miles per day than motor cars, which only average ahout one third these speeds. The reason that locomotives cannot he run as many hours as motors is their limitations of wear and tear. They cannot stand coutinuously the rough and tumble treatment that motors are suhjected to, and they have to he run into the round-house and he thoroughly examined and cleaned up for the next day's run. The importance of the hearing of this fact is evident. When electric motors of larger size and for higher speed come, as they inevitably will, to take the place of locomotives, they will he run approximately the same number of hours as the motors now in use, and will therefore cover from two and a half to three times the distance now covered hy locomotives. The third fundamental advantage of electric traction in this competition is that the motors used to draw a train can he placed under one of the cars. This will reduce the weight of the train, and therefore the power required to move it. The motor car could he made much lighter than the locomotive at present used, and this would give a further saving in power. Less weight would he carried on any one pair of wheels, and the weight would he more thoroughly spring-supported. This would materially reduce the strain on the track, and consequently the cost of maintenance.

Electricity, of New York, which does not devote all its space to censorship of the General Electric Co., says that to have one's hair singed off hy electricity is the latest development of the tousorial art. The apparatus to perform this operation consists simply of a platinum wire stretched over a comb. By pressing a hutton in the handle of the comb current is applied to the wire, and it is heated to a white heat. The comb is passed through the hair, and as the wire comes in contact with the hair it is hurned off, the end of each hair heing cauterized as cut, which process prevents the loss of the oily substance with which the hair is filled. The apparatus is connected hy flexihle cord and attachment plug to a lamp socket, and can he used hy any harher of ordinary skill. A New York electric company manufacture the device.

Combined Electric Lighting Station and Waterworks.

An ingenious comhination of an electric lighting station and city waterworks is oprating successfully in a small German town. Dnring the day, when the consumption of water is greatest, the station accumulators are charged and the water supply is worked hy the steam pump. When the accumulators are charged, and in the morning, hefore the hoilers are heated up, the electrically-driven pump is worked from the accumulators, in case of a large demand for water. In the evening, when the lamps are turned on, the current is taken direct from the dynamo, and at 11 o'clock, when the street arc lamps are cut out, whatever further supply of current is necessary is taken from the accumulators. If a fire should occur in the night, a full supply of water is instantly availahle. On the sounding of the alarm, the attendant at the station starts the electric pump and one compressor. The perfect success of this plan has heen proved on several occasions, and the inhahitants of the little town are proud of their compact and efficient plant, which gives them good and cheap lighting, good drinking water, and a sufficieut supply of water for all purposes of fire extinction. The station is operated at a very low cost, but hy employing automatic current regulators, automatic oiling apparatus on all the moving parts of the steam engine, and hy using ring oiling devices on dynamos and motors, the working of the plant is to he so simplified that one engine driver and a stoker can look after the whole installation, even when some proposed extensions are completed.

Popular Electrical Theories.

A history of popular misconceptions on electrical subjects would make entertaining reading. The superintendent of a Kansas electric light station tells that among a thousand puzzling inquiries that were addressed to him on the night that the electric light was started in his city, was the poser: "Where is the hole in the wire that the juice comes through?" An electrical supply firm in Nova Scotia has lately received the following letter from a Cape Brenton correspondent: "Will you kindly let me know all particulars ahout the incandescent lamps which you advertised in the *Recorder?* That is, what is used in them, is it kerosene oil, etc., or, if not, what is it? And can the material he easily ohtained? Also let me know if the light from your lamps is much superior to the ordinary kerosene ones. I am desirous of getting one or more of them, and would like to know all ahout them." A well known London weekly paper gravely puhlishes amoug its hits of electrical information the announcement that: "A German electrician recently hived a swarm of hees hy the use of electricity. He passed a powerful current through the hough of a tree on which they clustered and the stock causcd them to fall stupefied to the grouud. Before they had time to recover he had them collected and placed in a new hive." An inventive genius, who hails from Columhus, O., has discovered that "if two dissimilar conductors of electricty which are suhject to slight atomic change under the influence of sound are joined together after the manner of a pair of thermopile hars, and the open ends are insulated hy a suitahle nonconductor of hoth sound and electricity a current is generated when sounds are made in the vicinity of the exposed ends. If two or more such elements are connected together we have an acoustic battery, and hy increasing the number of elements it is possible to operate an ordinary call hell by simply clapping the hands in front of the exposed ends of the hattery." This sounds impressive. The way in which the inventor proposes to turn his inspired idea to account is to establish an electrical perpetual motion and among other things to wind clocks by the noise of their own pendulums and light shops hy the noise of the machinery. A contemporary says: "By this scheme also an auctioneer may yet run an electrical cash system with the sound of his own voice; some janitor by the force of his profanity may story up electricity enough to ring a church hell; policemen in noisy hoots could furnish street lights; the mooing cows may furnish power to cut their own fodder; and a harking dog may keep au electric light hurning by and hy on the lawn."

THE report of the General Electric Company for the year ending January 1, just puhlished. shows: Gross earnings, $13,336,611; operating expenses, $11,451,864; net profits, $1,811,747; against $3,189,884 the preceding year; halance, $1,347,164; depreciation, $933,521; surplus, $413,643. This declares seven per cent dividend on the preferred stock, or $297,640 per annum, leaving for the common stock in the year 3.44 per cent. The report states that as a result of the Ball decisions there will be less profit than formerly in the lamp business, and that of the decrease in hills and accounts receivahle there was written off $2,291,844, accounts due hy 466 persons. The estimated value of the company's patents is unchanged.

Cable Address, American.

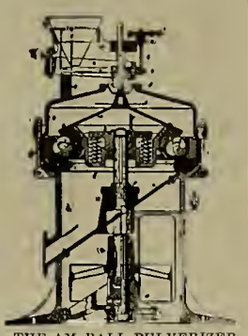
First Prize and Gold Medal Awarded by World's Fair, 1893.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows less; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with less than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours.

CLEVELAND IRON ORE PAINT CO.



THE AM. BALL PULVERIZER
Morris Patent.

P. & B. INSULATING TAPE. ARMATURE VARNISH. ELECTRICAL COMPOUND.

STANDARD OF EXCELLENCE—USED IN ALL FIRST-CLASS ELECTRICAL WORK.

PARAFFINE PAINT CO.

116 BATTERY STREET, SAN FRANCISCO.
221 SOUTH BROADWAY, LOS ANGELES.

Sole Manufacturers of P. & B. Paints, Roofing, Building Papers.

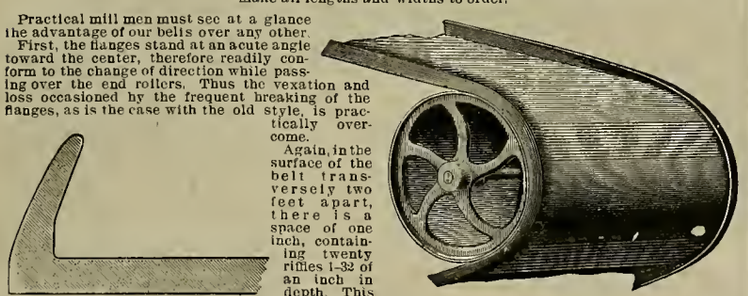
Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty rifles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.



H. G. BLASDEL, JR., Manager,

419 California Street, Haywards Building..... San Francisco.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

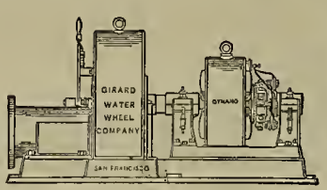
Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,
121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Girard Water Wheel Co.,

34 MAIN STREET, - - SAN FRANCISCO, CAL., U. S. A.

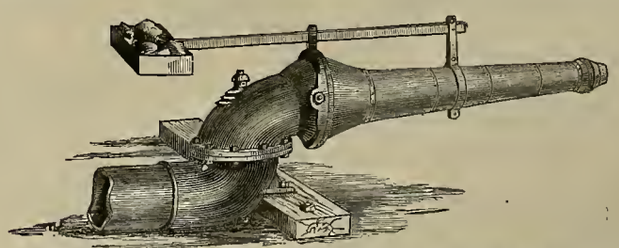
WATER WHEEL

CASCADE WATER WHEEL

Adapted to all heads, from 30 FEET TO 2000 FEET. Our experience of 33 YEARS in the water wheel business enables us to suit every requirement of water power plants. Send for illustrated pamphlet. This new wheel has given an unequaled Economy in Water.

JAMES LEFFEL & CO. Springfield, Ohio, U.S.A.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL NOTES.—An installmeut of the wages due the miuers of the Mayflower and original Amador mines has been paid. The men have not resumed work.

The Keystone Company, owing to the disaster of the fire and the expense of rebuilding the mill, have run behind with their payments, but it is believed that the yield of the mill is sufficient to enable them to gradually wipe out the indebtedness. They were five months behind some time ago; now they are only two months in arrears. In a short time they expect to be eveu.

John Allisoo, owner of the Allison quartz mine, near Plymouth, has sold a one-half interest in the property to Messrs. Garrity and others of Stockton, the purchasers assuming a mortgage debt upon the mine of $2000.

The Bay State mine, near Enterprise, is reported bonded to Johu English for the sum of $161,000, payable in six months.

JACKSON DISTRICT.—S. W. Bright has returned from this city where he was in consultation with the people who are preparing to work this mine. Their attorney has passed favorably upon the title to the properties and now it is supposed the purchaser's representatives will get to work in a short time.

The new reservoirs at the Kennedy are uow being utilized.

The Argonaut is down 720 feet, the last forty of which was in black slate. The machinery will all bo in running order in a few weeks.

SUTTER DISTRICT.—Supt. Parks tells the *Ledger* that within the year the South Eureka will have a mill. The contractors are at work driviug south at the 1050 level, toward the ore bodies which were developed at the 900 level. This work is being done at $3.48 per foot. They have made a uew ore dump recently from which their wagous were to be loaded to haul to the mill, and have also put a uew No. 5 blower iu to supply air to the lower levels.

AMADOR DISTRICT.—The Keystoue company is contemplating the construction of a chlorination works with capacity sufficient to handle sulphurets from their own mill.

DRYTOWN DISTRICT.—The sulphurets works at Drytown was started up last week and will run for the season.

SUTTER CREEK DISTRICT.—Tweuty stamps of the Mahoney mill have beeu put in first class condition and ten are dropping. The other ten will he started up when the conceutrator and plates arrive.

El Dorado.

PLACER CLAIM SOLD.—*Republican*: Messrs. Finch, Stevens and McKinney have sold their placer miuing claim, 80 acres, to parties connected with the Grand Victory mine. There is believed to be running through this tract of mineral land a large vein of ore that, when developed, will be of immense value.

THE BLUE GOUGE.—The Blue Gouge quartz mine, on Camp creek, has been sold to English capitalists. It is the intention to have a 60-stamp mill running by the first of September and to have chlorination works constructed on the ground ready for use before winter begins.

Inyo.

THE HIRSH MINE.—*Register*: Mr. Geo. T. Rives, who will superintend operations for the Eastern company which recently purchased the Hirsch mine, arrived last Friday evening, accompauied by Mr. J. D. Bancroft of Chicago, one of the parties interested. With them came Surveyor S. P. McKnight, who is now engaged in making surveys of ditch to utilize the water power of the Inyo canal, a mill site and tramway from mine to mill. A ten or fifteen stamp mill will be put up as speedily as material and machinery cau be procured, also required buildings at mine and mill. The tramway will probably be a little more than a mile in length. A few men will he put to work in the mine at once, and it is hoped to have the stamps dropping within ninety days.

Mariposa.

A LONG TUNNEL.—The Mariposa Grant Company now purposes the construction of a long tunnel at Shepherd's Point above Benton Mills, to tap the Pine Tree and Josephine mines, the completion of which will greatly facilitate operations in the future on both veins and give them command of all the lower levels.

Mono.

A BIG SUIT.—*Chronicle-Union*: On Weduesday a complaint in trespass for $283,000 damages was filed in the Superior Court by the Standard Con. Mining Company, plaintiff, against the Bodie Con. Miniug Company. The plaintiff alleges that the defendant entered its mining claim, called the West Bullion, hy means of underground tunnels and workings, as early as 1884, and since said time has repeatedly extracted and converted to its use ores, belonging to plaintiff, from the ledges known as the Burgess and Second South Ledge. The complaint alleges that plaintiff did not discover said facts and trespasses until 1894. The miuing ground is situated in Bodie, and the plaintiff and defendant are the two leading companies of the Bodie district.

Nevada.

FEDERAL LOAN.—A five-foot quartz ledge carrying free gold is reported in the Federal Loan mine.

THE ENGLISH MOUNTAIN.—*Tidings*: A new pump for the Euglish Mountain mine was loaded at Nevada City, Thursday, and started for the mine. The mine will start in a very short time, with Chris Mallon as superintendent.

THE FORTUNA.—The water has been pumped out of the Fortuna mine, and a crew of men has beeu put to work. Two shifts will be thoroughly and systematically worked. Ben Penhall of Grass Valley is aeting as superintendent of the mine.

Placer.

THE RISING SUN.—The Rising Sun mine at Colfax started up last week. It was formerly owned by the Coleman Brothers and paid a number of divideuds. A New York company has control of the mine now. A tunnel will be run in from Bear river to tap the ledge.

Plumas.

THE BUTTERFLY MINE.—*National-Bulletin*: Chas. D. Kellogg, Superintendent of the Butterfiy mine, west of Quincy, has gone to San Francisco to purchase four Frue Concentrators to use in connection with his stamp mill. The boiler and engine once used at the Riverdale has been moved to Butterfly and it is now heing placed in position so that the ten stamp mill may be run by steam. Undoubtedly the Butterfly mine is a success. There is ample ore in sight to keep the mill running a long time.

THE DRURY MINE.—The fifteen-stamp mill on the Drury mine started up last week. There are several hundred tons of ore ready for milling.

Riverside.

"INVESTIGATING."—Five Englishmen, representing the San Jacinto Estate, Limited, who own 47,000 acres, known as the Gavilan grant in Riverside county, are investigating the mines on the property with a view of opening up the most promising. The Temescal tin miues are located on the company's land.

THE GOOD HOPE.—Perris *Record*: During his visit at the Good Hope mine last Monday, Receiver Naftzger paid off and discharged all but a few of the men. These will be kept at work doing only what is necessary for the protection of the mine, such as pumping and keeping up the timbers. How long the mine will remain closed it is impossible to say, but it is believed operations will not be resumed until all litigatiou is settled, which may be several mouths distant. We are sorry for this, as the Good Hope has heen of great financial benefit to Perris. Nearly all the late employes of tbe Good Hope have left for new mining sections, many of them going to Arizona and Colorado.

Shasta.

AT IRON MOUNTAIN.—D. R. Cleary, one of the owners of the Iron Mountain miue, has arranged to have the wages of the eighty-five men employed there inereased.

It is reported that the Mountain Mining Company have accepted the survey for the new railroad from the mine to Spring Creek, and that they will build their smelter there with a capacity of 5000 tons per day.

THE IRON MOUNTAIN.—The Redding *Free Press* says: The survey on which the engineers have been at work is completed and a plant will be located near Copley capable of reducing 1000 tons of ore daily. Development work has shown a splendid ledge of copper ore, it is said that $10,000,000 cannot buy the property.

It also says that "Judge Cleary sold the mine to two factions in London, one of which represented the Rothschilds, through Hill, of the Rio Tinta mine of Spain; the other faction is represented by Fielding. These factions combined, put up $300,000 for the mine and $200,000 working capital. Cleary was given one-third of the stock, unassessable. Of the purchase priee, $300,000, Cleary paid to the original owners $205,000, thus making by the deal ahout $100,000 and a third interest in the property. It is stated that Cleary has combined with the Rothschilds interest, aud has become the master mind of the institution."

Tuolumne.

GENERAL NOTES.—*Union-Democrat*: The mine purchased by J. A. Weston, at Groveland, has been leased to the Wheeler-Hill Mining Company, which will soon commence work.

Eugene Elshree, of Sonora, took out $500 Wednesday in the Stewart-Wainwright claim. This makes a total of $3300 taken out hy him during three weeks last past.

Mr. Birney, of Saw Mill Flat, says that place is looking up, and that the following are some of the indications: Spencer, McNassau & Co. are representing and working the Geo. Winnie placer elaim. Zimdar and Griffen are mining out the Dunnegan ranch ground. Thos. Conlan and Ben Pownall are working the Marcus quartz mine. Thos. Conlan & Co. are hydraulicking the King and Hennessy placer elaim. Messrs. Ferguson and Hawley are reopening the Fox quartz claim.

NEVADA.

KENNEDY DISTRICT.—Ore is being hauled to Winnemucca from the Gold Note mine at Kennedy. A shipment of twenty tons was made this week to the Selby Smelting Works. It averaged nearly $100 per ton. It is thought possible that suitable works for treating the ores of Kennedy will be built this summer.

LINCOLN CO.

Improvements at the Bullionville mill are still being made, and the latest is the addition of a new fifty-ton leaching tank. At the Advance mine a body of gold ore is heing taken out from drifts at the bottom of an incline seventy feet deep, and the average on the three-foot vein is $40 per ton—a free-milling proposition which is being worked in the Bullionville mill. A tunnel is now being run in from the surface to tap the lower workings of the shaft, and the intention is to run tunnels at different depths.

Washoe District.

The following are official reports:

GOULD AND CURRY—200 level—West crosscut No. 5 started in northwest drift, 432 feet from main west drift, was advanced 11 feet; total length, 1,410 feet face in hard porphyry.

250 level—Resumed work in south drift and advaneed it 10 feet, passing through porphyry, clay and quartz; total length, 115 feet.

BEST AND BELCHER—250 level—Resumed work in the north drift and extended it 6 feet, passing through quartz and porphyry.

800 level—East crosscut started from north drift 75 feet from west crosseut; No. 2 was advanced 17 feet, passing through porphyry and stringers of quartz; total length, 32 feet.

CON. CAL. AND VIRGINIA—1,650 level—On ninth floor (first floor above sill floor of this level) at end of crosscut run west from drift, run south from east crosscut, from drift run south from south end of stope, an upraise has heen carried up 32 feet, in quartz formation of low value. On twelfth floor drift, running south from east crosscut, has been extended 15 feet; total length, 163 feet, in porphyry. On third floor from opening made, from drift run south from main north lateral drift, on sill floor of this level; the south drift has been advanced 25 feet; total length, 41 feet, in a quartz formation assaying $2 and $5 per ton. On second floor in working north have extracted 9 tons of ore assaying $25 per ton.

1,750 level—The opening on seventh floor, above sill floor of this level, has been enlarged to size of 16 feet in length by 6 feet in width, top being in ore 4 feet wide, assaying $30 per ton. From second, third, fifth, sixth and seventh floors have been extracted 144 tons of ore, making a total extraction for the week of 153 tons, the average assay value of which, per mine car samples, was $52.44 per ton. Bullion shipped tc San Francisco assay office value of $30,371.

OPHIR—1,465 level—Drift running north from top of upraise carried up 80 feet above sill floor of this level, from a point in east crosscut from main north lateral drift, has been extended 19 feet; total length, 365 feet. Face in porphyry and quartz of low assay value. Have continued jointly with Mexican company the work of making repairs in main shaft from 1,100 level upward.

Central tunnel, 250 level—Crosscut running west from main south drift from bottom of winze, sunk from tunnel level, at a point 95 feet south from winze, has been extended 30 feet; total length, 186 feet. In porphyry, clay and quartz of low assay value.

Tunnel level—West crosscut running west from end of drift, run north from end of west crosscut from north drift from Mexican shaft, has heeu extended 20 feet; total length extended, 186 feet. Face in porphyry and clay, showing more quartz. The upraise started from old north drift from top of upraiso, carried up 46 feet above tunnel level, at a point 110 feet in from its mouth, has been carried up 14 feet; total height, 32 feet. Top in porphyry and quartz, assaying $1 and $2 per ton. Are clearing out and repairing north drift from top of upraise, 117 feet above tunnel level, and with prospect westerly therefrom in coming week.

MEXICAN—1,465 level--North drift started from top of upraise carried up 45 feet above sill floor of this level, at a point 40 feet west of main north lateral drift and 100 feet north from south boundary of mine, has been advanced 20 feet; total length, 394 feet. Face in porphyry, which shows narrow streaks of quartz of low grade. As joint work with Ophir company are making repairs in Opnir shaft ou 1,100 level and upward.

HALE & NORCROSS--Main shaft—Are doing some retimbering below 975 level.

975 level—Advanced north drift from No. 1 west crosscut 20 feet; total length, 60 feet. Face of drift has connected with No. 2 west crosscut. South drift from No. 1 west crosscut has peen extended 10 feet; total beight, 158 feet. Face in clay, quartz and porphyry. Have done no work in west crosscut No. 3, near northern boundary, the past week. Will resume work in it in a few days.

Intermediate level—Continuo stoping south on small streaks of ore above this level. Shipped to Brunswick mill during the week 180 tons ore, being the entire accumulation of ore in ore house at this date, assaying, per railroad car sample, $55.50 per ton. The assay value of this ore per mine car sample averaged $51.40 per ton. The mill is expected to commence crushing ore to-day (the 25th inst).

ALASKA.

JUNEAU MINING CO.—*Record*: The Juneau Mining Company now has 75 men at work on their claims in the Basin and work is being pushed as rapidly as possible. It is the company's intention to have sufficient ore on the dump to start the mill as soon as completed.

ARIZONA.

SALE OF THE WATERS MINE.—*Courier*: A mining sale of immense importance was consumated in Prescott on Saturday last. It was the sale of Waters mine on the Santa Maria, for $40,000, by D. C. Thorne and Thomas Bowe. Clarence Clark, at present of Phœix, was the purchaser. Five thousand dollars was paid down and the balance is to he paid at stated times within a year. The purchaser has let a contract for a twenty-stamp mill which is to be completed within sixty days from date. The stamps are to weigh 850 pounds each, California pattern, and cyanide tanks will also he put in. The Waters is developed by over 400 feet of tunnel, and shows a strong vein of good milling ore. It is said that the purchaser has a large lot of contract work to let, and miners out of work may do well to inquire into the matter.

THE CONGRESS MINE.—*Journal-Miner*: The main shaft of the Congress mine is now down to a depth of 1,400 feet and a fine body of ore is exposed at that depth. This is as deep as they can sink with the present hoist. The old shaft will be sunk to an equal depth when the two will be connected by a drift. The company is now employing nearly 300 men. A cyanide plant of 100 tons capacity is approaching completion and will be used in working the old tailings. Another large plant will be erected soon to work a certain class of ore found near the surface and of which there are thousands of tons.

BRITISH COLUMBIA.

TRAIL CREEK'S WEALTH.—Rossland *Miner*: Trail creek is now producing $4000 a day in solid gold. During 1895 it will export $2,000,000 worth of the precious metal, or five per cent of the whole output of the United States. Who in Canada knows or cares anything about so comparatively uninteresting a fact, and what enterprising Canadian capitalist is reaching out a hand for a share in the golden shower? Trail creek is now greater than Cariboo in its palmiest days and more permanent, but British Columbian ears are so stuffed with the traditions of Cariboo that the noise of a present-day movement disturbs them no more than it would the lotus-eaters of Alfred Tennyson.

REOPENING OLD CARIBOO MINES.—An English company is reopening the old Cariboo placer mines—the old placer mines—and sending steam pumping and hydraulic machinery. These mines were abandoned many years ago after the miners had got out as much as they could of the surface gold. One of the mines held by the widow of an old-time miner, and unsalable before, has just been bought by the company for $30,000.

GENERAL NOTES.—The Peters Creek Mining Company has formed with $25,000 capital to work deep mines on Peters creek, near Stanley.

The Le Roi, War Eagle and Josie together are shipping 100 tons a day, most of which goes by Trail. The number of teams hauling has been increased.

The Blue Bell mine is shipping about 100 tons a day to the Pilot Bay smelter. An air compressor, electric-light plant and four drills will be put in. The wages paid are $3.50 a day.

Rossland miniug recorder's office took in $1400 in April for records and the general receipts were $2000.

GOLD HILL DISCOVERIES.—Marvelous stories are told of the new gold discoveries at Grouse mountain, just at the international boundary, seveu miles from Rossland, British Columbia.

Ten claims have been located, the property of Capt. Burbridge, Maj. Sidney Waters, W. J. C. Wakefield and A. Symous. The claims are named the Orizaha, Grouse, Alice, Phœnix, Ætna, Alpha, Alta, Knight Templar, Interuational and Tiptop No. 4. These claims are included in a rectangle about 4,500 feet on each side, just touching the international boundary, lying on the British side. In these claims, so far as now known there are nine gold bearing ledges running northwest and southwest, with two cross veins running nearly at right angles to them. These ledges, with the exception of one of the cross veins, are asserted to be free milling gold-bearing rock, averaging in widtb from three to fourteen feet, and, so far as known, assaying from $9.00 to $41.00 in gold to the ton. The ledges are porphyritic syenite formation.

COLORADO.

LEADVILLE FLUXING ORES.—One of the noticeable features in the miuing situation at tbe present time is the rapid increase in the argentiferous iron production, says the Leadville *Herald-Democrat*. There are some smelters which are not in the market, they still having a heavy supply on hand, but now that the contracts with the producers of Wyoming are expiring, the local and valley smelters are returning to their old market and a number of large contracts have been made.

IDAHO.

THE POORMAN.—*Inter-Mountain*: The reports from the Poorman property in the Cœur d'Alenes are encouraging at present, but tho outlook for the future is discouraging. At present about 190 men are employed, and some 300 tons of ore are heing miued of a low grade character. A rich strike was made recently on the east drift to the tenth level, which assayed fifty-uiue ounces in silver, forty-five per cent lead and bismuth, thirteen per cent copper, and $2 in gold.

The discouraging feature is the decision of the board of directors to stop work on the mine as soon as the bodies of ore on the east and west drifts of the tenth level are exhausted. The mine is excessively wet, and is now heing operated at a daily expense of $725. The pumping plant is an expensive one, compressed air being used to lift the water to the 500 foot level. At this point an electric pump earries it to the surface, its capacity being stated at 500 gallons per minute.

To continue operations it would be necessary to sink the shaft to an additional depth and to do so at the prevailing prices for silver and lead, with the heavy expenses entailed, would mean a great loss. Therefore, when the present ore hodies are exhausted, the pumps will be drawn and the Poorman will be hermetically sealed until the metal market improves.

MINING FOR MICA.—F. N. Hallett has ten men working in the mica mine near Juliaetta. There is a tunnel in 150 feet which shows good prospects. The owners intend to put on an increased force if mica is found in paying quantities.

NEW DEVICE FOR MINING.—H. M. St. Cyr is about to make the test of a new pump which is under construction at Portland, to be used in placer mining for pumping sand. The first experiment will be made on the Snake river, three miles below the mouth of the Payette. The pump is twenty inches in length aod eight inches diameter. It is on the end of a scow which contains washers connected with a pipe through which the sand is distributed. In the suction ehamber of the pump are four steel flukes, upon a central shaft braced with steel collars. The power of a twenty-inch pump is claimed to be sufficient to supply 400 tons of sand to each separating machine during twelve hours. In Mr. St. Cyr's mind this pump is one of the simplost devices ever introduced into the operation of placer mining.

MEXICO.

NEW GOVERNMENT REGULATIONS.—The new tax on gold and silver has become a law, and goes into effect on the 1st of next month. It

is the most important mining measure which has taken effect in Mexico in many years, and what its ultimate influence will be on the mining interests of this country is hard to foretell. American ore buyers are greatly wrought up over the new imposition of five per cent additional taxation, and freely prophecy that many companies, especially the smaller concerns, will be driven out of the Mexican markets, as aside from this tax there are the other long established state and national contributions to be paid. Others hold that the tax is not so bad as it looks, and that the government will not injure the mining industry by thus increasing its revenues. The full text of the new laws is as follows:

In addition to the taxes imposed by articles four, five and seven of the decree of June 6, 1887, silver and gold shall pay to the federation the following mintage, stamp, refining, melting, assay and separation dues:

From and after July 1 next the deduction hitherto made on the intrinsic of gold and silver entered at the mints for the purpose of defraying the cost and fees of mintage shall be abolished. In consequence, persons entering the precious metals shall be credited for each kilogram of pure silver at the ratio of $40.915 1000, and for each kilogram of pure gold at the rate of $675.417-1000. These values shall be taken as the basis for the estimation of the mintage and stamp dues hereafter to be mentioned.

(b) The mintage fees on gold and silver shall be reduced to two per cent of their value, payment of such fees being made in silver coin.

(c) The stamp imposed by the law of April 25, 1893, on the certificates issued by the mints and that imposed by the same law on gold and silver in bars, are hereby repealed, and in their stead a new stamp on gold and silver is created, the amount of said tax to be three cents per $1 on the value of the gold and silver. From the payment of this tax no one shall be exempted.

(d) The mintage and stamp dues shall be payable not only with respect to silver and gold entered at the mints, but with respect to bars of either metal, or of the two metals mixed, that may be exported. Also, with respect to silver sulphides, to argentiferous lead and copper, to ores in the natural state, to concentrates or ore only partially dressed, and to any alloy, object or substance containing gold or silver.

(e) The mintage and stamp dues shall be paid in the assay office or at the mints with respect to gold and silver introduced for coinage, and in the same offices or at the maritime or frontier custom houses with respect to gold and silver exported in any form.

(f) The only exemption from the payment of the mintage fee with respect to silver exported shall be enjoyed by the metallurgical establishments at present enjoying such exemption under their concessions, provided always that the proportion of silver argentiferous lead does not exceed seven-thousandths, and that in argentiferous copper fifteen thousandths, for in case the proportion of silver exceeds the amount named said establishments shall pay the mintage fee with respect to the excess.

(g) Ores of gold or silver exported in the natural state or only concentrated mechanically shall be subject to the mintage and stamp tax with respect to the value of the gold or silver which they contain, with allowances of five per cent.

(h) The exemption with respect to three-thousandths which all the exporters of certain classes of metal have enjoyed is abolished.

(i) The refining, melting, assay and separation fees shall be collected according to a schedule of prices to be formed and published by the treasury department.

(j) The owners of silver bars containing gold may have the separation of these metals performed in private establishments, and in case they introduce mixed silver into a government assay office they may have the gold separated up to the limit desired, on payment of separation fee per kilogram, in accordance with a schedule to be issued by the treasury department.

(k) The federal executive shall issue the necessary rules of practice for the enforcement of the above taxes, and shall fix the penalties to be visited on persons who shall attempt to evade or shall evade the payment of the taxes on gold and silver, of which the exportation without payment of mintage and stamp taxes shall be considered as a case of contrabband.

(l) From and after July 1 next all laws and regulations with regard to federal taxation on gold and silver opposed to the foregoing basis shall be repealed.

MONTANA.

THE ROYAL MINE.—W. Bennett brought in 450 ounces of gold bullion yesterday from the Royal mine, and deposited it as usual at the Helena assay office, says the Helena *Herald*. The value of the little lump of retort is about $7000, and it is the second deposit of the kind the Royal Company has made this month, the first deposit being 460 ounces, valued at about $7200. This makes a total in four weeks of $12,200, all pounded out of Royal ore by a ten-stamp mill.

Since September, 1893, when the mill was started, the Royal has produced $119,000, or an average of about $6000 per month, including a few months, when work had to be suspended on account of water. Month in and month out the profits are about one-half the total product of the mine, the mine being worked inexpensively by a system of tunnels, the ore being free-milling and the gold easily saved.

Heretofore the mining has been done by the primitive method of the pick and shovel, but now Mr. Bennett proposes to put in a modern drilling plant, with air compressors and all necessary machinery for operating air drills.

THE LONE PINE.—*Inter-Mountain:* The Lone Pine and Jay Hawk Mining Company closed down its mill at Ponsonby some four months ago, and at present but eight miners are employed in exploiting the company's properties on upper Quartz Hill.

The Lone Pine is in reality the deepest shaft in Montana, being 1900 feet on an incline into the bowels of the earth. It was originally located by the Partridge brothers, who worked it at a great profit for ten years and then sold it to a syndicate for $65,000. About six years ago the Jay Hawk Company, which was then operating a non-paying property in Marysville, purchased the Lone Pine for $350,000 and erected a twenty-five-stamp mill which cost in the neighborhood of $100,000. For two years the property turned out an immense quantity of silver, but at the 1100-foot level the vein was lost; and although the shaft was extended 800 feet farther at an enormous expense, no ore was found. This is practically the condition of things at the Jay Hawk to-day. The upper levels are worked out, and there is not a trace of ore at the bottom.

OREGON.

PLACER MINE SOLD.—Jacksonville *Times:* The sale of Ennis & Cameron's placer mines in Galice Creek district to Messrs. Bent and Alexander, formerly of Colorado, has been confirmed. The new firm will take possession as soon as their predecessors finish cleaning up this season's work, which will be the latter part of July. In the neighborhood of $20,000 was paid for the property.

IN THE GRANITE DISTRICT.—The ores of Granite mining district are principally gold, but more than one-half is contained in the sulphurets, says a writer in the Baker City *Democrat*. Following are the proportions of gold and silver of the principal mines: The Union, three parts gold, one part silver; Companion, same; May Flower, seven parts gold, one part silver; Red Boy, Stella and Forest Queen, same; Last Chance, three parts gold, one part silver; Eaton Bros.' mine, nine parts gold, one part silver; Golden Star, same; Moonshine and Maverick, three parts gold, one part silver; Mountain Chief, two parts gold, one part silver; Conundrum, nine parts gold, one part silver; Elephant and Poorman mines, three parts gold, one part silver; R. T. Lungrell's mine, ten parts gold, silver none; Tellegobhle mine, nine parts gold, silver none. The Tellogobhle is under bond for $50,000, and J. Barr Robertson pays for the same, should the property prove valuable.

GRANT CO.

BOUGHT AND BONDED.—The Elk Creek Mining Co., which some time ago bought the Sloan & Haskell placers for $27,000, have bonded the quartz properties for $23,000. They work nineteen men in the mine, from which gold has been taken out for twenty years.

BAKER CO.

SUSPENDED TEMPORARILY.—Mining and mill operations at the Baisley-Elkhorn mine have been suspended until the sale of the mine under execution in favor of the First National Bank of Baker City takes place, which will occur as soon as the proper publication of sale is made.

SOUTH DAKOTA.

HOLY TERROR SOLD. — *Mining Review:* A three-fourths interest in the Holy Terror mine, one-third interest in the N. Pope claim, one-third interest in the Star-eyed Egyptian Nos. 1 and 2, and a three-fourths interest in the Holly Terror mill and mill site, are sold. The purchasers are to sink to the depth of 300 feet from the bottom of the present shaft and to pay within fifteen days $22,500 of the purchase price, $82,500. The optional purchase is to extend six months from date of payment of the $22,500. John George and Charles M. Kipp, of Chicago, are the purchasers.

UTAH.

THE BULLION-BECK.—Tintic *Miner:* The Bullion-Beck has passed its regular monthly dividend, and it is stated that there will be no more dividend payments for some time, owing to the heavy expenses to which the company has been put recently.

THE MAMMOTH.—The recent ore strike in the Mammoth mine is more important than has been told. The ore body is on both the 1100 and 1200 levels, and is on an average three feet wide. It is very rich in gold, running from twenty to sixty ounces to the ton.

VIRGINIA AND GEORGIA.

GLITTERING GENERALITIES.—South Africa is not the only country where the gold hoomer gets in his fine work. Our own fair land has the same species. Coast miners will be amused at the following, which was received at this office this week:

"Last September the writer could buy for the first time any property lying on the south bank of the Potomac river at anything more than its surface value. In panning a bushel of dirt with a three-pint tin basin he found $7.50.

"The owner heard about the gold, but never went to see the land. Said it cost him less than $50 per acre and he could afford to sell for $100 per acre, $5000, which was accepted. A practical miner immediately asked for an option at $12,500 and other parties took an option from him at $25,000. A Pittsburg millionaire, who has a gold mine in Colorado that is paying him ten per cent per month, heard of the gold finds here and in the south, and sent an agent to examine. He selected eight yards of sand and washed it carefully and found $26 in nuggets without saving the fine gold. He estimated the sand in this gulch within reach of the river at 100,000 yards and immediately negotiated for an interest in the option. The average of some of the veins is from $88 to $126 per ton and the mine is sure to add largely to the millionaire's estate. Additional options have been taken on 150 acres of land at $100 to $300 per acre, which could have been bought two years ago for $25 per acre. While this condition of things exists ten miles from the national capital, agents are trying to sell in Washington California placers that will wash 15 to 25 cents per yard.

"A Washington mining engineer, Mr. S. J. Davenport, just from Lumpkin county, Ga., has loaned me a mining map of the county.

"Without counting, I should estimate over 100 mines working. One company is operating 600 stamps. Other parties are operating 10 to 20-stamp mills in all directions. One company has built 41 miles of main pipe line, 30 and 36 inches in diameter.

"Three dredges are at work on the Chestatee river, averaging from $100 to $1000 per day, and others are projected.

"Without doubt Lumpkin county is producing to-day more gold than Leadville, Cripple Creek or Deadwood. Northern mine owners are selling their property for what they can get and investing in the South. Atlanta is only 100 miles from this point, and the coming exposition will bring visitors to the locality and add to the mining boom. The Rothschilds are said to have four mining experts in the South selecting the choicest investments. John Gorham, the great manufacturer of silverware, has purchased three of the best mining properties and told me that he should set 500 men at work during the year."

The shysters will soon be abroad with gold properties in the South stocked at $1,000,000 to $10,000,000, and dupes will buy the stock at five cents per share.

WYOMING.

THE BABY BOY.—C. E. Griffin of St. Louis is at the Baby Boy gold property, near South Pass, and has a force of men at work changing the course of the Sweetwater river, which now flows over a heavy vein of gold-bearing quartz. The Baby Boy Mining and Milling Company was recently organized under the laws of Kansas, and has a backing of $5,000,000.

Riedler Pumping Engines.

Fraser & Chalmers, of Chicago, send a list of recent orders filled by them for the Riedler Pumping Engine, built for various municipal corporations, mining companies, etc., and say:

"To express the importance of the Riedler system in Continental Europe we have made a list of fifty large cities where it is given the preference, Berlin alone having some nineteen Riedler pumping engines of large capacity. This is by no means all, but it is enough to impress the mind with the consequence of the Riedler system. In the United States we have been engaged for only about two years in the manufacture of Riedler pumping and blowing engines, air and gas compressors. The dimensions and data of the pumps and compressors built and put in successful operation are given in the order of construction, and are enough to show a growing appreciation of the system in this country. The speeds stated are high, but not maximum, as higher speeds can readily be employed. For pumping, the Riedler system, with its positive closing water valves, secures singular avoidance of shock, and is found to work with beautiful smoothness and entire security at speeds which would imperil an ordinary pump.

"In addition to the list given, we have recent orders for a number, both of compressors and pumps. Among these, we are building for the Pennsylvania R. R. Co. a 12 and 19x16-inch cross-compound non-condensing slide valve engine actuating a pair of 7x16-inch Riedler duplex pumps. These illustrate the range of capacity readily obtainable. At 95 revolutions the capacity is 500 gallons against 600 feet head, but the speed may be increased to 142½ revolutions, with a corresponding increase in capacity.

"An engineering arrangement of less usual character is exhibited in the Riedler air-compressing pneumatic and pumping machinery ordered by the Delaware, Lackawanna & Western R. R. This will comprise, first, a 17 and 28x24-inch cross-compound condensing Corliss engine actuating a 14 and 23¼x24-inch compound air compressor. The capacity at 110 revolutions will be 1150 cubic feet of air per minute, steam pressure (initial) 100 pounds, air pressure 110 pounds. The air pressure will be transmitted about 3800 feet (3000 horizontally, 800 vertically), and will actuate, with a guaranteed efficiency of 90 per cent, a compound pneumatic engine 15 and 21½x18 inches, which in turn will drive two 5½ and 5¾x18-inch differential pumps. These, at 120 revolutions, will lift 700 gallons a minute against a head of 770 feet."

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from John B. Rathburn et al in the Lost Camp mine, near Blue Canyon. Placer county, to impound tailings behind brush dam in Woods Ravine; and from A. J. Mason, in the McFadden mine, near Mokelumne Hill, Calaveras Co., to impound tailings behind brush dam in Buckeye gulch, gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., June 17th, 1895, at 1:30 P. M.

ALBERT MALTMAN, Practical Metallurgist and Engineer.

SAMUEL C. THOMPSON, A. B. Yale University. E. M. Columbia University.

Maltman & Thompson,

MINING ENGINEERS AND METALLURGISTS,

Owners of Nevada County Reduction Works,

Address: Grass Valley, Nevada County, California.

Inspect and report upon Mineral Properties, Treat Refractory Gold Ores and Concentrates by Chlorination. Furnish Plans for and Superintend Erection of Colorination Plants, General Analyses of Ores.

References:

Timothy Dwight, President Yale University, New Haven, Conn.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law, Mining Patents and matters before the Land Department a Specialty. Crocker Building, Rooms 201, 202 and 203, San Francisco.

The Evans Assay Office.
W. N. JEHU, Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.
Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

EDWARD S. COBB,
Mechanical Engineer and Expert.
Tests and Estimates for the Improvement of Pumping, Power and Hydraulic Plants.
Will supervise the Construction, Shipment or Erection of Machinery. Will make Drawings, Estimates or Specifications.
Prices obtained for machinery of every description. Twenty year's experience.
23 Davis St., Rooms 30 & 31, S. F., Cal.

GILES OTIS PEARCE,
Mineralogist and Metallurgist.
708 Colorado Avenue, Colorado City, Colo.
Will examine Mines, Ore Bodies, Mineral Belts or Zones, and make written Mineralist Reports, fees for which made known upon application for services. I make my own assays and select my own samples when examining mines. Eighteen years' experience. Analysis of water and soils.

CHAS. S. HARKER, E. M.,
Attorney-at-Law and Mining Engineer.
Makes a specialty of *Mining Law*. Patents obtained on mineral and agricultural lands. *Investments and reports made.*
Full charge taken of property for absent owners.
Offices: 16 & 17 No. 26 Montgomery St.,
SAN FRANCISCO, CAL.

Almarin B. Paul, M. E.,
Mining Operator,
ROOM 58, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the investment of CAPITAL in RELIABLE Mining Enterprises, also will give attention to the sale of, and reporting on RELIABLE Mining Properties, or the procuring of suitable Machinery for Interest in Developed Mines.

MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

Practical Information.

The Skies of June.

In the south and southeast, but a short distance to the east of and below the beautiful white star, Spica, there shines during the June evenings the object in which the interest of planetary astronomy is centered at present. The steady yellow glow of Saturn, in the position described, is made noteworthy by the recent announcement of Prof. Keeler's discovery as to the composition of that planet's famous rings. A brief review of what we know of these unique appendages will make the latest news concerning them more intelligible.

As early as 1610, Galileo, while watching Saturn with his new-made telescope, saw that there were apparently three bodies making up the planet. A little later he looked again, but in the meantime the rings had been turned edgewise to the earth and were invisible in his glass. He uever explaiued the mystery; but Huyghens, in 1655, solved the problem and announced that Saturn was encircled by a ring. The next step in the progress of discovery was taken by Cassini, who found the ring douhle. Another division, making three rings iu all, was discovered by Bond in 1850. Since that time Saturn has been a favorite ohject in the telescopes of both professional and amateur astronomers. No other planet had such an appendage, and the beauty of the system with the eight satellites was such as to keep up the interest. Very little, however, was learned of these wonderful planetary girdles. The plane of the rings is inclined to the plane of the ecliptic at an angle of about twenty-eight degrees, so that twice in the planet's revolution of twenty-nine and one-half years the rings are turned edgewise to the earth. The whole ring system is ahout 36,000 miles wide, and there is a distance of ahout 10,000 miles hetween the inmost ring and the surface of the planet.

Of course the nature of these rings was an object of discussion as soon as they were discovered. The first and most natural theory, that they were solid, was overthrown hy a mathematical demonstration that such could not be the case and yet the rings survive; the same fate hefell the theory that they were liquid; and the only reasonable supposition left was that they were composed of a multitude of satellites, too small to he seen separately, moving in nearly circular orbits about the planet.

For a second time in astronomy has the observer confirmed the previous announcement of the mathematician. The existence and exact location of Neptune was demonstrated hy computation of the irregularities in the movement of Uranus before the former planet had heen recognized as such hy human eyes. Now Professor Keeler brings from his observatory photographic proof of the satellite theory of the composition of Saturu's rings.

Professor Keeler made his discovery hy means of the spectroscope. The spectra of the planet and the two opposite sides of the rings were photographed on the same plate, and it was found that the inner edges of the rings moved faster than the outer edges—a condition which could not be true if the rings revolved as a whole. An attempt has heen made to deprive Professor Keeler of the credit for his work hy alleging that he only has confirmed what had previously been announced hy other astronomers and what has heeu the generally accepted theory for the past twenty years. Granting all this to be true, Professor Keeler has brought the first visual proof that the rings are not solid, aud that fact is enough to make him famous among the astronomers who have contributed to our knowledge of this distant world.

Saturn, as has heen said, is to the east of and helow Spica, in the constellation Virgo. The planet comes to the meridian or is due south at 9:20 P. M. on the 1st of June, 8:22 P. M. on the 15th and at 7:22 on the 30th. As an additional means of identification, the moon is in conjunction with Saturn ou the night of June 3d, although some seven degrees farther south than the planet.

Of the other planets, Mars, Jupiter and Mercury are all in the western sky during early June, but all are so near the sun as to make it difficult for the amateur astronomer to distinguish them. Mercury may be found low down near the west-northwest horizon about an hour after sunset during the first four or five days of June. It will take a good glass to find the shy planet, as, although he is farther from the sun than he was at the elongation last Fehruary, his disk is not uearly so bright.

Jupiter is rapidly approaching the sun. He is in conjunction with Mercury twice during the month—once on the morning of the 7th and again on the evening of the 21st.

Of Venus no words of praise or description of location are needed. The queen of the planets is superior to anything the June skies can present. She reigus supreme in the western heavens all the early evening. Find the hrightest object in the west as soon as the twilight hegins to deepen, and that is the planet Venus. Next month she reaches her greatest distance east of the sun and soon afterward attains her maximum brilliancy.

Three first magnitude stars are the conspicuous ohjects of the eastern sky during the June evenings. They are Antares, Altair and Vega. The first may be seen low in the southeast after nine o'clock on the 1st of June and after eight o'clock on the 15th, and may he recognized hy its fiery red color. Its very name, Antares, means "rival of Mars," and it can well be compared with the reddish hue of the planet so prominent in the east last autumn. Antares is in the constellation Scorpio and in one hranch of the Milky Way. Rising a little later and farther north is Altair, marked hy two hright attendants—one on each side. The arrangement is so peculiar that it attracts attention at once. Thc constellation is called Aquilla, the eagle. Although one will have no trouhle in finding Altair, it is difficult to discover any resemhlance to the great American bird in the collection of stars of which Altair is the chief. In fact, there are very few constellations which at all approach in appearance the ohjects they are named after. When an amateur begins watching the stars, it is the bright ones he first picks out, and the knowledge of the constellations comes later. The other first magnitude star, Vega, is high in the northeast at nine o'clock on the 1st of June. Steel hlue in color, hrighter than any of its neighbors, it is an easy object to distinguish. Vega is one of the three brightest stars north of the celestial equator. The others are Arcturus and Capella. Arcturus at this time holds a position almost overhead. The curve of the three last stars in the handle of the dipper, if produced, comes to Arcturus. Capella is setting in the extreme northwest, not to appear again until, in the last of August, late in the evening, its rays appear above the northeastern horizon and herald the approach of winter, for it shines nearly overhead at nine o'clock on the January evenings. These three stars—Vega, Arcturus and Capella—are of nearly the same hrilliancy, and each is beautiful, but in a different way.

Dagos and Gringos.

There can be no doubt that the word Dago is derived from the Portuguese word Diego (James), the patron saint of Portugal. Ahout thirty-five years ago an exhaustive research was made to ascertain the derivation of this word, with this result: The first recorded instance of its use was a customs entry, about the year 1820, of a ship belonging to Davis & Brooks, which traded hetween New York and Mediterranean ports. The skipper, after writing in the entry his name and that of his mates and American sailors, wound up with and "three Dagos." He was asked for an explanation hy the Custom House people, showing that the word and its meaning was new to them. He replied that he meant three Portuguese, all of the same name, Diego, which he had spelled incorrectly, and that he had shipped them at Funchal.

In those days Italian sailors were seldom found out of the Mediterranean, and Spanish sailors only on Spanish ships, but the Portuguese sailors would take a berth on any craft without regard to the flag it sailed under, so it was very hard to find a ship without two or three natives of either the Azores, Canary, or Cape Verde islands among the crew. They made splendid sailors and worked cheap, an important consideration in the eyes of Yankee skippers, particularly whalers, who invariahly sought these islands on their way to the Pacific to complete their crews and catch the southwest trade winds.

The name Diego was so plentiful among these Portuguese sailors that it got to be the custom to call them all "Diego" or dago, much as all the Chinamen are called John. As they were a good-natured lot they took it kindly, until along in the 40s the manner of its application became offensive to them. Since then it has been appiled to Spaniards, Italians and all dark-skinned people other than negroes.

An equally iuteresting story can he told of the word gringo, so much used by our Mexican neighbors. The accepted version of this word's origin is to the effect that some American sailors, ashore on the harhor of Mazatlan, getting water, sang the old ditty, "Green Grow the Rushes O," and the natives took kindly to the melody, ever afterward calling the Americans gringos. The year 1845 is given as the date of this happening. Now, as long ago as 1825 the firm of Howland & Aspinwall did an immense business with the west coast of Mexico. Their agents in Mazatlan were the Messrs. Barre & Kennedy. There is in New York city, in the family of Robert Lennox Kennedy, a letter from Mr. Lewis Barre of this firm, dated Mazatlan, 1825, which speaks of an entertainment at his house, and that on the recommendation of one of the captains of Howland & Aspinwall's ships in the harbor, a sailor furnished the music. The captaiu vouched for him as heing a very talented fiddler, and it turned out that the fellow played but one tune, "Green Grow the Rushes O." This was his entire repertory. They danced everything to this tune, singing the song at the same time, and the entertainment furnished lots of fun.

In a subsequent letter he writes that from this entertainment his Mexican friends had evolved a nickname for Americans that was coming greatly into use, gringo, which was as near as they could come to the pronounciation of "green grow." It is easy to see how this word could become a word of opprohrium among people who did not know its origin. Certain it is that, Mr. Barre, an old and respected merchant in Mexico, had never heard of it previous to this time, 1825.

LAKE SUPERIOR has a surface measurement of 32,166 square miles. Islands of Lake Superior have an area of 660 square miles and the hays an area of 1041 square miles, leaving a total area of open lake water surface of 30,465 square miles. The boundary line over the lake between the Dominion of Canada and the United States is 200 miles long. The combined area of the great lakes of the St. Lawrence is 95,275 square miles, and a third of this is formed hy Lake Superior.

DURING the summer months of June, July and August the best longitude of crossing the line for vessels bound to Atlantic ports in the United States is ahout 37° west, and for vessels hound to Europe about 21° west; but the latitude in which they will lose the southeast trades and probahly enter the northeast trades will vary from 3° 30 min. to 13° 20 min. as the season advances. In the Pacific, for vessels hound north the longitude of 118° is hest.

THE Paris exhibition of 1900 is to cost four millions sterling, and will cover an area of nearly 2000 acres.

Market Reports.

The Markets.

SAN FRANCISCO, May 30, 1895.

There was scarcely any change in the markets during the week, lead dropping a few points from the recent advance. Silver holds up, hovering around the 67 mark. The Chinese indemnity calls for 51,000,000 oz. of silver yearly. There is thought to be 700,000,000 oz. of silver in China now, but it is doubtful whether the Government will be able to get hold of it, and must go to Europe for a loan. China must pay Japan 372,668,000 silver dollars, or its equivalent in bullion, which Japan proposes to spend at home in strengtheuing her navy and coast defenses, and providiug war material exhausted in her recent struggle with Chiua. A London special says: "With the decline in New York exchange, the demaud for gold in tbe open market has entirely disappeared."

New York Metal Market.

NEW YORK, May 30.—PIG IRON—Scotch, 19@20c; American, 9.50@10.50c.

COPPER—Brokers', 10.50c; exchange, 10.60c.

LEAD—Brokers', $3.07½; exchange, $3.10.

TIN—Straits, 14.85@14.95c.

SPELTER—Domestic, $3.60.

New York Silver Prices.

NEW YORK, May 30.—Following are the closing prices for the week:

Mining Share Market.

SAN FRANCISCO, May 30, 1895.

There was a general improvement in the market this week, and a better feeliug imparted by the proposition discussed at length elsewbere to consolidate some of the Comstock properties, explore new ground and co-operate with the new management of the Comstock Tunnel Company. Such action would infuse business vitality into the market.

Bodie Con. tumbled 50 per cent in price during the week by reason of the Standard Company's suit against it for $283,000, value of ore alleged to have been taken by the former from the latter's ground during the years '84–'89.

Discussing the proposed consolidated purchase of part of the Brunswick lode, the Virginia *Enterprise* says:

"It is almost certain that rich ore will be struck at some point in the Brunswick lode if it is thoroughly explored. The history of the Comstock shows that the croppings were not particularly rich in character, and if a private individual had owned the Con. Cal. & Virginia miue it is altogether probahle that its wealth would never have been unearthed, as an immense amount of money was expended in prospecting before the bonanza was struck. The Brunswick lode is immense in size. Its croppings are all mineral-hearing, and in many places tbe owners of claims on it have taken out great sums of money by gouging near the surface. The Brunswick lode is, if anythiug, more promising in character than was the Comstock before it was developed."

The following illustrates the changes of the week:

539,455.—SACK FILLER AND SEWER—A. T. Timewell, Spokane, Wash.

539,461.—CINCH PLATE—A. P. Weeks, Santa Cruz, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained tbrough Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SURVEYING INSTRUMENT.—Frank Batter and William Murphy, of Marshfield, Oregon. No. 539,605. Dated May 21, 1895. The object of this invention is to provide an instrument which, while not of exceeding accuracy or convenience of construction, is suitable to be placed in the hands of boys and learners for the purpose of assisting them in learning the rudiments of this class of 'mathematical work and the use of instruments connected therewith. It consists of a box having sockets in its sides whereby it may be detachably supported in different positions upon a tripod, observation tubes pivoted upon one of tbe sides and movable about their pivot points, graduated quadrants attached to and turnable with the tubes, with locking thumb screws to hold them in any desired position, and a circular revolvable dial pivoted to the side of the plate and having a cord passing around its shaft connected at one end with one of the quadrants and at the other with a tension spriug, and a plumh line so arranged that when the apparatus is set on edge it may he properly leveled for work.

MEANS FOR CLOSING ENDS OF CANS AND READILY OPENING SAME.—Andrew Jackson Ritter, of Mammotb, Ariz., assignor of one-half to G. H. Barnhart, same place. No. 539,545. Dated May 21, 1895. This invention relates to the class of devices for soldering or otherwise closing the ends of tin cans and which will permit of tbeir being readily opened again. The device consists of a trough or channel ou tbe can body, formed by returning the edge of the can body parallel upon itself and then bending it upwardly and outwardly; a cover for the body, having a depending flange adapted to enter the trough or cbanuel; a wire fitting said trough or chaunel and practically filling the space between its outer wall and the flange of the cover, and a breakable layer of solder bridging the trough or channel over the wire and connecting the wall of the trough or channel witb the cancover flange. To opeu the can a projecting end of the wire is grasped, and the wire is torn forcibly from its seat, the solder, which is a thin layer, yielding readily. The solder heing thus broken, the fastening between the cover and can is severed and the two may be easily separated.

WANTED.

SIX OR EIGHT-INCH CENTRIFUGAL PUMP

For pumping water and fine gravel. Address CENTRIFUGAL, MINING AND SCIENTIFIC PRESS.

EASTERN PARTY WANTS A

Good-Paying Gold Mine or Good Prospect.

All communications strictly confidential: give full description. Address MINE, this office.

MICHIGAN MINING SCHOOL, Houghton, Mich. A high grade technical school. Practical work. Elective System. Summer courses. Gives degrees of S. B., E. M. and Ph.D. Laboratories, Shops, Mill, etc., well equipped. For catalogues write to the Sec'y. M. E. WADSWORTH, Ph.D., Director.

ANY ONE KNOWING THE ADDRESS OF

GEORGE P. HARRIS

Will confer a favor on the undersigned by writing the desired information to the address given below. Mr. Harris left Albany three or four years ago for Colorado, and a letter of inquiry to his brother elicited the information that his address was Trinity Centre, Trinity Co., Cal., but a letter addressed to him there was returned marked "uncalled for." E. J LANNING, Albany, Oregon.

860 ACRES OF MINERAL LAND FOR SALE.

Lead, Zinc, Onyx and Marble. Three miles from Missi-sippi River in St. Genevieve County.

PRICE, $25,000.

PHIL. A. HAFNER, Benton, Mo.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

No dust. No ashes. Cheap, effective, economical, portable and automatic.

SEND FOR PRICE LIST TO

W. HOSKINS, 81 South Clark St., Room 51, CHICAGO, ILL.

Carlisle Gold Mining District.

I have six quartz claims on two parallel leads, 1500x1200, for sale upon reasonable terms. Large ledge; ore goes $10 per ton. Will sell for cash or on a milling proposition. Location, Clifton, Arizona, close to Carlisle District. Send for synoptical report.

J. F. CROSETT,
628 Sacramento St.....San Francisco.

Assessment Notices.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of May, 1895, an assessment (No. 49) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 2d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virgin a City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the first (1st) day of May, 1895, an assessment (No. 41) of Fifteen (15c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 20-22 Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the first (1st) day of June, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the seventeenth (17th) day of June, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22 Nevada Block, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, La Porte, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of May, 1895, an assessment, No. 1, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of June, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, California.

California Granite.

The ancient, intrusive granite is one of the most noted and abundant of California's structural materials, being present and unsought in nearly every county in the State. There are almost as many varieties as localities where found, the general term "granite" being applied to many masses of rock that strict mineralogical classification would place differently.

In many parts of the State railroad facilities have made possible the opening of granite quarries, the commercial value in several instances being considerable. In Placer county, at Rocklin, Griffith, Gould & Towles, and Penryn, are large quarries constantly worked, and from that locality has come much of the granite in use in this city. At the Griffith quarries, near Penryn, is opened up what is said to be the only true black granite quarry in the State. Extensive polishing works form a part of the quarrying plant at this point. The State Prison granite quarry at Folsom, Sacramento Co., also furnishes a large amount of granite. Considerable granite quarrying is also being done in the southern part of the State. One of the largest granite quarries in the world is about three miles southeast of Raymond, Madera county, a light gray granite of even texture, so lying as to admit of separation into immense blocks. One is described about two years ago as having the entire force of 70 men then at work on it; it was 325 feet long, five to fifteen feet in thickness, and exposed for fifty feet in width, without seam or flaw. Views on this page and on page 361, engraved direct from photographs, give a good idea of the appearance of this quarry. Another view is also presented of a notable quarry of syenitic granite at Rocky Point, near Exeter, Tulare Co. The cut shows ancient Indian painting, and the more practical effects of the modern blast. In quarrying at Rocky Point, two holes are drilled about fifteen inches apart, and at such an angle that they intersect about six feet from the surface. They are first charged with six inches of black powder and fired; then loaded with eight inches of black powder and fired again; the third charge consists of twelve inches of black powder. In this way a block 40×40×25 feet is split through its greatest length.

ROCKY POINT GRANITE QUARRY, TULARE COUNTY, SHOWING INDIAN PAINTINGS AND EFFECT OF A BLAST.

RAYMOND GRANITE QUARRY, MADERA COUNTY.

Some weeks ago it was stated in this column that it was no longer fashionable to talk of "hard times" in the East. It is largely a habit, this talk of "hard times," a habit that is chronic with many. Times are always "hard" with some people, despite any amount of money they may be making. In the industrial world an increased volume of business East and West is manifest, and increased wages by many leading firms is notable. To date 247 companies, firms and individual employers have announced an increase in wages from five to twenty per cent. In all but two of the 247 the increase was made voluntarily. The 247 noted are nearly all iron and steel workers, giving employment to nearly 200,000 men and boys. Doubtless statistics in other lines of trade and manufacture would exhibit equally gratifying results. The case of the Carnegie Steel Co. is illustrative of the improved condition of affairs. The 15,000 employes of this company, as its several plants at Homestead, Braddock and Pittsburg, Penn., were working under contracts by which their wages were fixed for the year 1895. The company informed them May 14th that "notwithstanding the existing contracts," it had "decided that the present business outlook will justify higher wages," which were accordingly advanced ten per cent beginning last Monday. The firm of Jones & McLaughlin, of the American Iron Works at Pittsburg, voluntarily increased the wages of 4000 men, and the Consolidated Steel and Wire Co., of Chicago, did the same in their five big mills near Chicago. These several advances put the wage rate almost back to what it was in '92.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Rocky Point Granite Quarry, Tulare County, Showing Indian Paintings and Effect of a Blast, 357. Raymond Granite Quarry, Madera County, 357-361. Grass Valley in 1853, 360.
EDITORIALS.—California Granite; No Longer Fashionable to Talk "Hard Times," 357. Number of Readers of Weekly Papers; Annual Report of the American Iron and Steel Association; Capitalization of Mining Companies; General Business Activity; Transmission of Power; Last Thursday's Meeting, 358.
SCIENTIFIC PROGRESS.—Scientific Food Preparation; Nearly Six Miles Above the Earth in a Balloon, 363.
MECHANICAL PROGRESS.—Gas Motor Street Cars in Germany; A New "Natural" Method of Wood-Preserving, 363.
ELECTRICAL PROGRESS.—Will Ten Volts Kill? The Powerful Fire Island Light; Galvanic Battery Efficiencies, 364.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 366-67.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 370.
MISCELLANEOUS.—Concentrates; Personal, 359. Forty-two Years Ago, 360. Recent Decisions; Best to Advertise in; Mining under the Sea, 361. Compressed Air vs. Electricity; Increased Production of Gold; Coast Industrial Notes, 362. A New Form of an Old Cure for Stiff Joints; Water Power and Electric Transmission, 368. Notices of Recent Patents, 370.

Transmission of Power.

In the issue of May 18th, Mr. E. A. Rix contributed an article "Notes on Recent Compressed Air Plants," in which were discussed the details of several large air compressors being made for different parts of the State, more especially the 700 H. P. plant to operate the pneumatic guns at the Presidio, and the similarly notable apparatus designed for the North Star mine at Grass Valley, and deduced conclusions therefrom regarding the relative value and economic merit of compressed air and electrical transmission, commendatory of the former, in instituting a comparisou as to cost and limit of efficiency. The article has elicited considerable comment, and Mr. A. M. Hunt has replied to it in an article entitled "Compressed Air vs. Electric Power Plants for Mining Purposes," in which he takes issue with Mr. Rix and challenges the correctness and accuracy of his statement. The closing sentence of Mr. Rix's article was.

> It is entirely probable that any ordinary compressed air transmission can be installed at no greater expense than an electrical one and with better economic results.

The closing sentence of Mr. Hunt's rejoinder was:

> It is entirely probable that an ordinary electric transmission can be installed at less expense than a compressed air one, and with better economic results.

This, then, may be regarded as the central contention of the disputants.

Without the slightest claim to originality, and with the fullest knowledge that this has been pointed out before in better phrase and clearer manner than the writer can command, it is in order to observe that while the PRESS welcomes the discussion as tending to better establish the merits of both systems of transmission, that there really exists no rivalry: the matter is more co-operative than competitive. As in other forms of transmission there need be no antagonism between compressed air and electricity, each having a separate field of usefulness.

It is usual and natural for any well-informed man to zealously present the potency of any form of power or transmission of power which he represents and thoroughly understands, and such commendation is always commensurate with his belief in that particular form of energy with which he is most familiar. It is a matter of congratulation to the industrial world that the meager past broadens into a future of such promise, and that in the multiplicity of devices for development of power there exists such variety, capable of adaptability to any and every use.

It is not unusual to attempt to ignore or decry the steam engine: prophecies have been made that the gas engine would relegate to obscurity every other mode of creating or transmitting power; others have declared that the oil engine was par excellence the coming furnisher of impulse, and still others demonstrate that when it comes to efficiency of transmission the water wheel beats them all. All are partly right, none wholly. There is room for all: it is not a question of one job where one of the applicants is hired and the others are left: there is enough demand for each and every form of originating or carrying power, and neither steam nor compressed air nor electricity nor water nor anything else fills the field to the utter exclusion of all else.

In additiou, it may be said partly to clear away a little indistinctness in several communications received on this subject that the difference between a creator of power and a transmitter of power must be kept in mind. The cable that pulls along one of our city street cars simply transmits power—the power that the steam engine in the power house evolves through the medium of the fuel that feeds the boiler. Neither compressed air nor electricity can be considered as originators of power, though each makes a splendid transmitter of power. In this regard the much-abused steam engine that so many claim will soon be superseded has much the best of it, for it can and does create or evolve or originate power. Yet we do not view the steam engine as a competitor or rival of the air compressor or the electric motor any more than we view the two last named as competitors or rivals of each other. There are things that the air compressor can do better than the electric motor: there are things that the electric motor can do better than the air compressor: there are things that each or either can do better than the other. We consider the great and growing use of the one an excellent argument for the use of the other. There are conditions in which each is most effective, and neither one of them can do everything that the other can do.

There is so much to be done in the industrial world, and in these days of keen wits and close competition it is so necessary to success to do it in the best way, that it is well that in varying circumstances and differing conditions one has a choice of how power shall be evolved and transmitted, and from among the splendid creations of man's inventive genius can choose that best adapted to the immediate work in hand.

Since the above was in type an additional communication has been received from Mr. Rix, which is given space elsewhere, which is intended to bring the matter from the abstract proposition to a concrete demonstration, a specific case. All earnest, honest discussion elicits the truth, and in this as in other matters, intelligent controversy will add to the sum total of knowledge on the question.

As a business proposition, or a working proposition, it seems a mistake, though a common one, to have such extraordinary capitalization in the organization of mining companies. It is an every-day occurrence to hear of a new mining company organized "capital stock $1,000,000," "$5,000,000," or "$10,000,000." The enormous sum deceives nobody, and is usually an indication that legitimate mining is the last thing intended. Very seldom are seven figures necessary in announcing the capitalization of a mining company, and in those cases the names of the incorporators are the best indication of the corporate intent.

THE American Iron and Steel Association sends its annual report, a publication of unusual value. The statistics show an extraordinary fall in prices, yet an output greater than that of any year since '89, a compensatory showing that is suggestive of the highest form of mechanical progress. Improvement in methods and cost of manufacture have enabled the iron and steel interests of the country to pass through the stress of the past three years, meet foreign competition and export $30,000,000 worth annually, besides supplying nearly all domestic demands.

THE several trade journals received from "the East" show by their advertising columns that there is general business activity. There is no certain nor better business barometer than the advertising columns of a live journal in any branch of industry. Business in nearly every line is good, gives promise of being better, and the man who croaks "hard times" has no longer a semblance of truth in his plaint. It has ceased to be fashionable and is a reminuisance.

Last Thursday's Meeting.

The Executive Committee of the State Miners' Association was called to order by President J. H. Neff in the Maple room of the Palace Hotel at eight o'clock last Thursday evening. Secretary Ralston read sundry communications, among them one from the Selby Smelting Works, contributing $200. A communication from R. L. Dunn, of Auburn, regarding the reported desire of the railroad company to act in a spirit of fairness and justice, said, among other things, that:

> "For more than ten years past it has been the practice of the representatives of the land department of the Central Pacific railroad, at the hearings called by the local Land Offices for the purpose of having all interested parties present evidence as to the mineral or non-mineral character of the land listed by them, to represent to the mineral witnesses and claimants that, in order to avoid expense, if they, the mineral claimants, would not offer testimony the railroad would not, and that the effect of no testimony being offered would exclude it from listing at that time.
>
> "I have personal knowledge of this practice in that at one such meeting, when I had made surveys and maps of mines on listed lands and was present at the request of mineral land claimants to offer the maps in evidence, such representations were made to me and my principals, the attorney of the railroad saying, in fact, that our statements were sufficient as to the fact of the mines being there; that we need not go to the expense of giving testimony; that he would strike those lands off the list. Relying on such representations, the good faith of which we did not question, the maps and evidence were not offered.
>
> "As a fact, however, these lands were not stricken off of the list, but the representation was made and accepted in the Land Office (the hearing was held in Auburn), the attorney representing the railroad there being the same who had acted at the hearing, that inasmuch as no mineral evidence was of record at the hearing the land was therefore agricultural and should remain on the list. The register accordingly certified them as clear of mineral and ready for patenting to the railroad. I discovered this latter fact several years later.
>
> "I am informed, and believe, that the same course of fraud was practiced with reference to many others of the railroad lists. To the particular one cited above I am ready to make affidavit and appear in court if desired by your committee."

A. H. Ricketts made verbal report of his recent visit to Washington and the results. W. C. Ralston gave an account of his visit there at the same time, and of the stultifying and contradictory action and language of the officials in the Land Office Department. The report of the Committee on Mineral Lands was read. It recited the facts already reported, and asked for further advice and instruction. Treasurer Sontag read the financial report, showing that the receipts from Nov. 1st, '94, to June 1st, '95, were $4101.52, and the disbursements $4071.47. Discussion of ways and means to further the work and secure necessary funds was participated in by Messrs. Cross, Wright, Ricketts, Ford, Montagne, Neff and Ralston. Mr. Cross's motion that a form of protest, with explanatory circular as to how to prepare it to meet the exact requirements of the land officials, be prepared and furnished the miners of the State, was considered. Mr. Ricketts directed attention to the fact that the Government Land Office was controlled, in its regular routine work, by the clerks and underlings, who, in defiance of general rules, could and did favor the railroad company, regardless of the Secretary of the Interior, whose enormous mass of general business precluded any probability of special attention to any detail. Mr. Ralston's belief was that the Government Land Office was favorable to and largely controlled by the Southern Pacific Company. In this Mr. Ralston's experience agrees with that of everyone who has had business therein. Mr. Wright stated that he had heard intimated that a proposition was in abeyance from the S. P. Co. regarding an amicable adjustment of the matter of mineral lands. Mr. Crawford said that in conversation with Mr. Mills, the S. P. land agent, regarding the hostility of the Sacramento *Record-Union* to the mining industry, that Mr. Mills had stated that Mr. Huntington authorized him to propose that the association appoint a man, the S. P. Co. another, the two to travel together over the State and report what are and what are not mineral lands. The committee took no action in the matter. Mr. Loftus of Sonora had the secretary read an advertisement in a Tuolumne Co. paper of the intention of the Tuolumne supervisors to receive bids for a franchise for fifty years to build dams and charge toll on the Tuolumne river, and said that was a corporation scheme to control the water, and that, if successful, not only the mineral lands, but the water necessary for their working, would be tied up, and moved that the association send a protest to the Tuolumne supervisors, which, after some debate, was carried.

President Neff, Secretary Ralston, Senator Ford, chairman of the legislative committee, John M.

Wright, of the committee on protection to mineral lands, W. W. Montague and A. Carrigan, spoke earnestly regarding the need of money. San Francisco had done a great deal in the matter of contributions; had given readily and liberally, and would do more, but many of the mining counties where live the men in whose direct interest the contest was being made had not even sent their quota. Whether not realizing its importance, or through indifference, the contributions were either lacking or insufficient. The association committees were devoting their time to forwarding the work and funds were needed to properly carry it on. Senator Ford suggested that, inasmuch as the supervisors of the valley counties annually contributed thousands of dollars to the Anti-Debris Association, it was but just that in direct furtherance of their own interests the mining counties do the same toward sustaining the association that was fighting their battles for them. He made further plea regarding the new bill recently drafted by the Legislative Committee, and which will be presented in Congress next December, which amends Chapter 6 of Title 32 of the Revised Statutes of the U. S., transferring mineral land contests from the control of the Land Department to that of the courts of the counties wherein the land is situated. President Neff moved that the committee on mineral lands be authorized to continue its work and assured payment of its expenses, which was carried. He spoke at length on the condition of the association, thanked the press for the favorable publicity given its work and made an earnest plea regarding its financial needs, which are imperative. The meeting adjourned at 11:30 P. M.

These columns are held open twenty-four hours longer than usual to secure this brief recital of a very important meeting. As so urgently stated Thursday night, while the committees of the Association are thoroughly equipped and so ably and intelligently laboring for the prevention of absorption by the railway corporations of the mineral area of the commonwealth, and while the officers and members of the committees are well doing gratuitously work that is for the benefit of all; yet to continue requires adequate funds, not for salaries or offices, but for necessary clerical labor, and the different county branch associations, composed of the men most vitally interested in the matter, are urged to realize the fact and take immediate action.

Regarding the informal proposition from the S. P. Co. to create a commission, the committee could take no action, as it was not in tangible shape. Two joint commissioners are well enough if unanimous; but a third is needed. Then, it is a question if their findings would be accepted if contrary to the railroad's wishes or interests. Without giving the matter mature reflection, and with only such knowledge as that afforded by the brief outline of the scheme as placed before the meeting, the idea does not look feasible. It seems to be a move on the part of the company to divert and scatter the main work. It looks more like a surrender than a compromise, and the natural distrust of the company's methods militates against its favorable consideration.

Concentrates.

THE Morning Star Gravel Mining Company has declared dividend No. 54—$3.50 per share.

THE Bonanza Slide Drift Mining Company has levied an assessment of $10 per share, delinquent July 5th.

C. O. PERRY, C. E. Holmes and G. W. Fisher, of this city, have bought the Mount Ophir mine at Chili Junction, for $10,000.

THE proceeds, after expenses are paid, of the Nevada County Miners' Union picnic will go to the State Miners' Association.

THE directors of the Bullion-Beck, Utah, paid a dividend of fifty cents per share on the capital stock, amounting to $50,000, on May 29th.

THE Gila Monster mine, 16 miles north of Phœnix, Arizona, is reported sold to D. Kelsoe, of Atchison, Kansas, for $15,000. A 10-stamp mill is to be built.

NORTHEASTERN Trinity county is again attracting attention. The Humboldt Mining Co. has been reorganized at Eureka, and will engage in active work this season.

THE regular monthly rumor is afloat that the Rothschilds have bought the Anaconda copper mine. The report of the sale of the Old Dominion mine in Arizona is confirmed.

AT Rossland, B. C., there are a thousand men to-day where there were scarcely fifty six months ago, and properties that were sold then for comparatively small prices bring big figures now.

M. W. BREMEN has sold his three mines in Lost Gulch, near Globe, Arizona, to A. O. Brummel and J. B. Brown, of Washington, D. C., for the Kasser Gold M. & M. Co., who will build a 30-stamp mill there.

THE West Consolidated Virginia and California Mining Company has suspended work in their westerly workings on the 1100-foot level of the old Con. Virginia shaft on account of the strong flow of hot water.

THE African Gold Recovery Company (Limited) announce that during April 53,500 ounces of gold have been recovered on the Rand and 9,400 ounces in other districts; total 62,900 ounces. The March total was 62,500 ounces.

THE United States Geological Survey furnishes a report on the coal product of the United States for the year 1894, which shows a decrease of nearly 11,500,000 "short" tons from the product of 1893 and a decrease in value of over $22,250,000.

A DEED was recorded at Phœnix, Arizona, last week, in which F. J. Remers and Frank Prange conveyed all mining claims, machinery, etc., of the Harcuvar Mining Company to the Maricopa Mining Company, the consideration being $700,000.

THE Napa Consolidated Quicksilver Mining Co. will pay its regular quarterly dividend of ten cents per share on July 1st, and an extra dividend of the same amount on that date. The gross earnings for the three months ending June 1st were $65,700, and the expenses were $22,050.

FOR many years the *Bulletin* and *Chronicle* have given a good part of each week's issue to mining news, and of late the *Call* is doing likewise. Such publicity in the daily press is of value to the mining interests of the State, advertising our mineral resources and enlisting public attention.

THE deal between Wallace & Sons, the brass and copper manufacturers of Ansonia, Conn., and W. A. Clark, the wealthy Butte City copper king, who had been negotiating with the firm for several months, is off. The stockholders refused his offer and he declined to make a better one.

THE Yuma *Times* reports that the Cargo Muchacho mine, after years of successful working, closed down last week and all hands were paid off and discharged. The ore body has been exhausted in the levels and stopes and the company decided not to push prospecting any further at present.

FROM three different sources comes simultaneously this week the same question: "Can you tell when and where the copper plate was first introduced?" referring to the California quartz stamp mill. We confess our inability to answer the question. Can any of our readers give the desired information?

A RECENT DECISION says that, in the selection of a newspaper for publication of notice of mineral application, the register, in the exercise of proper discretion, may designate a paper that he regards best for the purpose of giving the greatest publicity to the notice, even though it may not be the paper published nearest the land.

THE manager of the Broken Hill Proprietary reports that for the week ending May 16th 7,320 tons of ore were treated, yielding 537 tons of lead, containing 203,129 ounces of silver; also 1,867 tons treated by amalgamating and leaching plants, producing 21,897 ounces silver. The price of the shares in Melbourne is £2 5s. buyers.

THE seven Comstock companies referred to at length in last Saturday's PRESS have decided to work together in securing 5000 feet of the Brunswick lode at $12.50 per foot, to be prospected from the Comstock tunnel at pro rata expense. Jos. Low is at present examining the ground and will shortly report upon the feasibility of the plan as outlined.

AN item is traveling through the Eastern press that California's gold yield in '94 was $40,000,000. Last January this paper figured it $14,000,000. Later and more extended data placed the aggregate at about one-third of a million less. California still leads the list of gold producing States. It is believed the '95 product will aggregate $16,000,000.

W. D. JAMES was killed by a cave at the Derbec gravel mine, near North Bloomfield, last Saturday. He and his partner were working in an upraise of the drift; they were warned at lunch not to go back again; it is said he made the remark, "If we are to be killed, we may as well eat and die with a full stomach." Returning to their work after lunch, they had scarcely lifted a shovel when the cave occurred.

MENTION was made some weeks ago that E. S. de Golyer, of Salt Lake, Utah, had bought the Gottschalk mine, a mile north of San Andreas, Calaveras county, and that he had begun sinking a three-compartment shaft on the west vein. It is now down 125 feet, and the owner has returned to Salt Lake to organize a company to develop the property, the results fully justifying the necessary expenditure of considerable money. He proposes to put up a forty-stamp mill, and has let contracts for 1200 feet of tunnel. A pipe line of 900 feet will be utilized in furnishing power.

JNO. P. JONES, Jno. W. Mackay, D. O. Mills, Irwin C. Stump and other moneyed men prominent in mining matters are about to form a New York company to promote the exploration and sale of American mining properties. The waning interest in the "Kaffir circus" in London and the renewed interest in gold mines in New York make the present an auspicious time for the organization of a big concern with plenty capital, which, rightly managed, will be of benefit to all.

AT the annual meeting of the stockholders of the Crown Point Mining Company 79,518 shares were voted. James Newlands, A. K. P. Harmon, J. P. Martin, James Newlands Jr. and C. L. McCoy were re-elected trustees. C. L. McCoy was re-elected secretary and W. E. Sharon superintendent. The secretary's financial statement showed a credit of $15,704. The superintendent's annual report shows that during the year they extracted from the 600 and 700-foot level stopes 18,650 tons of gold ore, of which 18,569 tons have been worked, the balance remaining on hand. From this ore was obtained bullion valued at $157,754, calculated at par, from which coin returns of $147,290 were received. The average fineness of the bullion was 574.9 in gold; its value per ounce was $12.42, and the yield per ton in coin $7.90.

THE Supreme Court has before it for decision a case, submitted with abundant evidence and argument last week, which is of unusual interest to prospectors and miners in general. Some time ago Robt. Woodburn agreed with Wm. Berry that he (Berry) was to go to Trinity county and get a quartz mine for him (Woodhurn). He was to pay him "big wages" and expenses in procuring the same, and if the mine so procured was a paying one, Berry was to have a half interest in it. Berry got the Globe mine, near Weaverville, for him; it proved valuable, but Woodhurn backed out and refused to deed Berry one-half of it. Berry sued him at Weaverville and a jury awarded him all he claimed. The court sustained the verdict, modifying it by the judgment that Berry should pay one-half the purchase price of the claim and one-half the cost of working it from the time of purchase to that date, and that Woodhurn should then give him a one-half interest, or Berry could secure a deed to the one-half interest by paying $4000 to Woodhurn. Woodburn appealed, and now the Supreme Court will decide the question, affirming or reversing the lower court.

THE annual statement of the Ontario, Utah, Silver Mining Company for 1894 is received. The Ontario has produced to date, since incorporation in 1877, over 30,000,000 ounces of fine silver; it has paid in dividends ever $13,000,000, and has furnished employment to hundreds of men. During the year the mill reduced 28,500 net tons of ore of an average assay value of 48.14 ounces silver per ton, saving 91 per cent. and producing 1,259,972 ounces of fine silver and 1102 ounces of fine gold. The milling cost on reduction was $7.19 per ton, and the total cost of all operating expenses was $22.72 per ton. There is an increased tonnage and assay value as compared with 1893 and a less per cent saved and a reduction in operating expenses, the total expense of reduction being $2.66 less per ton. After paying all expenses the cash balance has been increased during the year $173,557.88. The report says: "The mine has produced continually, and, with the former price for silver, could have paid dividends with equal regularity. Prior to 1892, the New York quotations averaged about $1 per ounce, and for the past three years it has averaged about 74½ cents, and for the past year 63 cents. This fall in the price of silver represents a loss to the company during the past three years, on 4,279,906 fine ounces silver (the product of the mine for that period) of $1,091,376.05, and for 1894, $497,420.82 on 1,343,291.45 ounces produced."

THE action of the Gold & Silver Extraction Co. of America vs. the Mercur, Utah, G. M. & M. Co., began this week at Salt Lake before Judge Merritt. The plaintiffs state they are the owners of the patents covering the cyanide process of extracting gold and silver from ore and that the defendants are infringing upon their patent; that contracts in September, '91, and kept till August, '93, between plaintiff and defendant were that defendant should pay $1 for each ton of ore it treated by plaintiff's process, and ask that defendants be decreed to account for and pay ever the income or profits derived from the use of the processes in the treatment of ores since August 15, 1893, and be perpetually enjoined from further infringement of plaintiff's patents. The defense deny that royalty can be collected, and claim that plaintiff's complaint is defective in not alleging that the ore contained base metal. It is a matter of common report that since they refused to pay the $1 a ton royalty the Mercur Co. has treated 150,000 tons of ore by the cyanide process. The $150,000 involved is, however, secondary to the main question of general royalty, this being viewed as a test case, and as such is of considerable interest to the mining world, affecting numerous cyanide plants in this country. The question before Judge Merritt is only a preliminary skirmish over the sustaining or overruling of a demurrer.

JUDGE CLEARY, who has been prominent in two recent mining deals, has brought suit against W. A. Nevills, W. H. Martin and J. Ballard. He represents Saunders, Fielding and Boyd, of London, New York and Chicago. Last February the defendants gave Cleary an option till June 1st on the capital stock of the Guild Gold Mining Co., for $1,300,000, comprising the Rawhide mine, the App, the Hitchcock and Heslep, and one or two other valuable gold properties in Tuolumne Co. Of the 100,000 shares, 95,000 were deposited in escrow with Wells, Fargo and considerable experting and inspection of the property ensued, the reports to the London syndicate being favorable. Doing business at such distance is necessarily slow, and the securing of such a sum not a momentary affair, so that when the option expired last Saturday, the deal had not been closed. Cleary saw that it would be impossible to get anything arranged by June 1st and secured a verbal agreement from Nevills to extend the time to July 1st. On Friday of last week Nevills and his partners notified Cleary that they would not extend the option, and the latter secured a restraining order from Judge Seawell preventing them from making any disposition of the property pending the outcome of the suit brought. Cleary recites the circumstances, asks that Wells, Fargo be enjoined from surrendering the deeds and stock, and that Nevills, Martin and Ballard be compelled to make good the agreement of Nevills to extend the option till July 1st, charging that they are trying to evade it, that he and the men he represents are acting in good faith and with all possible expedition, and that he stands ready to pay $50,000 on July 1st, and $1,150,000 on August 1st. In his complaint Judge Cleary, without directly stating it, intimates that W. A. Nevills had agreed to take a bribe of $200,000 from him to defraud his partners, Martin and Ballard, by getting them to agree to a lower price for the property than it was really worth. The defendants in their answer, which was filed last Monday, allege that Cleary offered Nevills a bribe, and also tried to bribe S. M. Shortridge, their attorney. W. A. Nevills says that immediately after the option to June 1st was given, Cleary proposed to him to take a share of the commission, that he seemingly assented, notified his partners, and had them behind a screen unseen witnesses and hearers of the bargain when subsequently made; that an agreement was drawn up in which he, Nevills, was to have $150,000 for himself; that when June 1st approached, Cleary asked for an extension, and offered him $200,000, that is, $50,000 more, for 30 days' more time; that such proposition was agreed to and a paper so drawn; that in his, Nevills, belief, Cleary never intended to pay him, but was trying to use the agreement as a means of blackmail, and that so far as he was concerned he kept his partners thoroughly informed of all Cleary's overtures, intending at the last to punish him for his alleged baseness. Nevills says he has notified Chas. W. Fielding, Cleary's principal, that the option will be renewed if desired, but not through Cleary, and that the $200,000 agreed to be paid to him by the latter must be included in the deal, and that Fielding has practically accepted the proposition. The whole story will receive further ventilation later on. Meanwhile richer ore than ever has been struck on the 600-foot level of shaft No. 2, of the Rawhide mine, which is the storm center of the dispute.

Personal.

THOMAS B. BARBOUR, representing the Risdon Iron Works, is in Salt Lake City.

PROF. GEO. LOWE will shortly begin the publication of a journal devoted to electrical matters.

SUPT. JAMES, of the Uncle Sam mine, and his son, W. M. James, of Kennett, leave next week for Johannesburg, S. A., where they will take charge of one of the Randt gold properties.

D. T. BUCKBEE, who recently resigned the superintendency of the Monte Cristo group of mines, in Washington State, is looking around the Grass Valley district in the interest of Montana capitalists.

Forty-Two Years Ago.

In the issue of May 25 appeared an article on the evolution of the quartz mill, which was illustrated by sectional views of "the premium battery of 1858," and "the model gold mill of '95." Further data and interestiug reminiscences are furnished herewith, and in addition is given an illustration from the original box-wood engraving of the town of Grass Valley, forty-two years ago, which will be of iuterest. to thousands of mining men throughout the world.

The mines in and arouud Grass Valley and Nevada City, Nevada Co., Cal., have been the maiustay of the California mining industry. The names of many of the leading properties are familiar as household words to all old-time Californians, and their varying fortunes are still watched with interest by multitudes of people scattered all over the world. As the scene of the earliest quartz mining the Grass Valley district is always interesting to the mining community, the more so in the matter of comparison of working results then aud uow.

To the scientific study of these mines and the different ore bodies opened up at intervals the world is largely indebted for much of the advancement which has been made in the manner of experting and developing mineral lodes. One of the most active pioneer workers in this important branch of the profession is the veteran Melville Atwood, the well known geologist of this city, whose services in the aid of science have already met with distinguished recognition in Great Britain, where his name has been enrolled as a member of many of the best-known scientific and literary associations. He has been a fellow of the London Geographical Society for over a quarter of a ceutury. Mr. Atwood has spent a lifetime in mining, and since 1852 his fortunes have been identified with the business on the Pacific coast. He originally came here to represent a London compauy, the Agua Fria, to manage their mines iu Mariposa county, but eventually took charge at Grass Valley. The following notes on early mining in Grass Valley district, and the working results of the ores, are supplied by Mr. Atwood, the data in nearly every case being taken from his memoranda:

The first Gold Hill quartz mill in the Grass Valley district was built iu 1851, and was of eighteen stamps. An English company, the Agua Fria, in 1852 purchased a coutrolling interest in the Gold Hill Mining Company, and in 1853 erected a tweuty-one-stamp mill, with Cornish crushers, etc. The engine, boilers, stamps and crushers were constructed by Bolton & Watt. The engine, a low-pressure one, was of the same pattern as those used in the old Beaver, the first steamer that ever doubled Cape Horn. It required very little fuel to run this machinery.

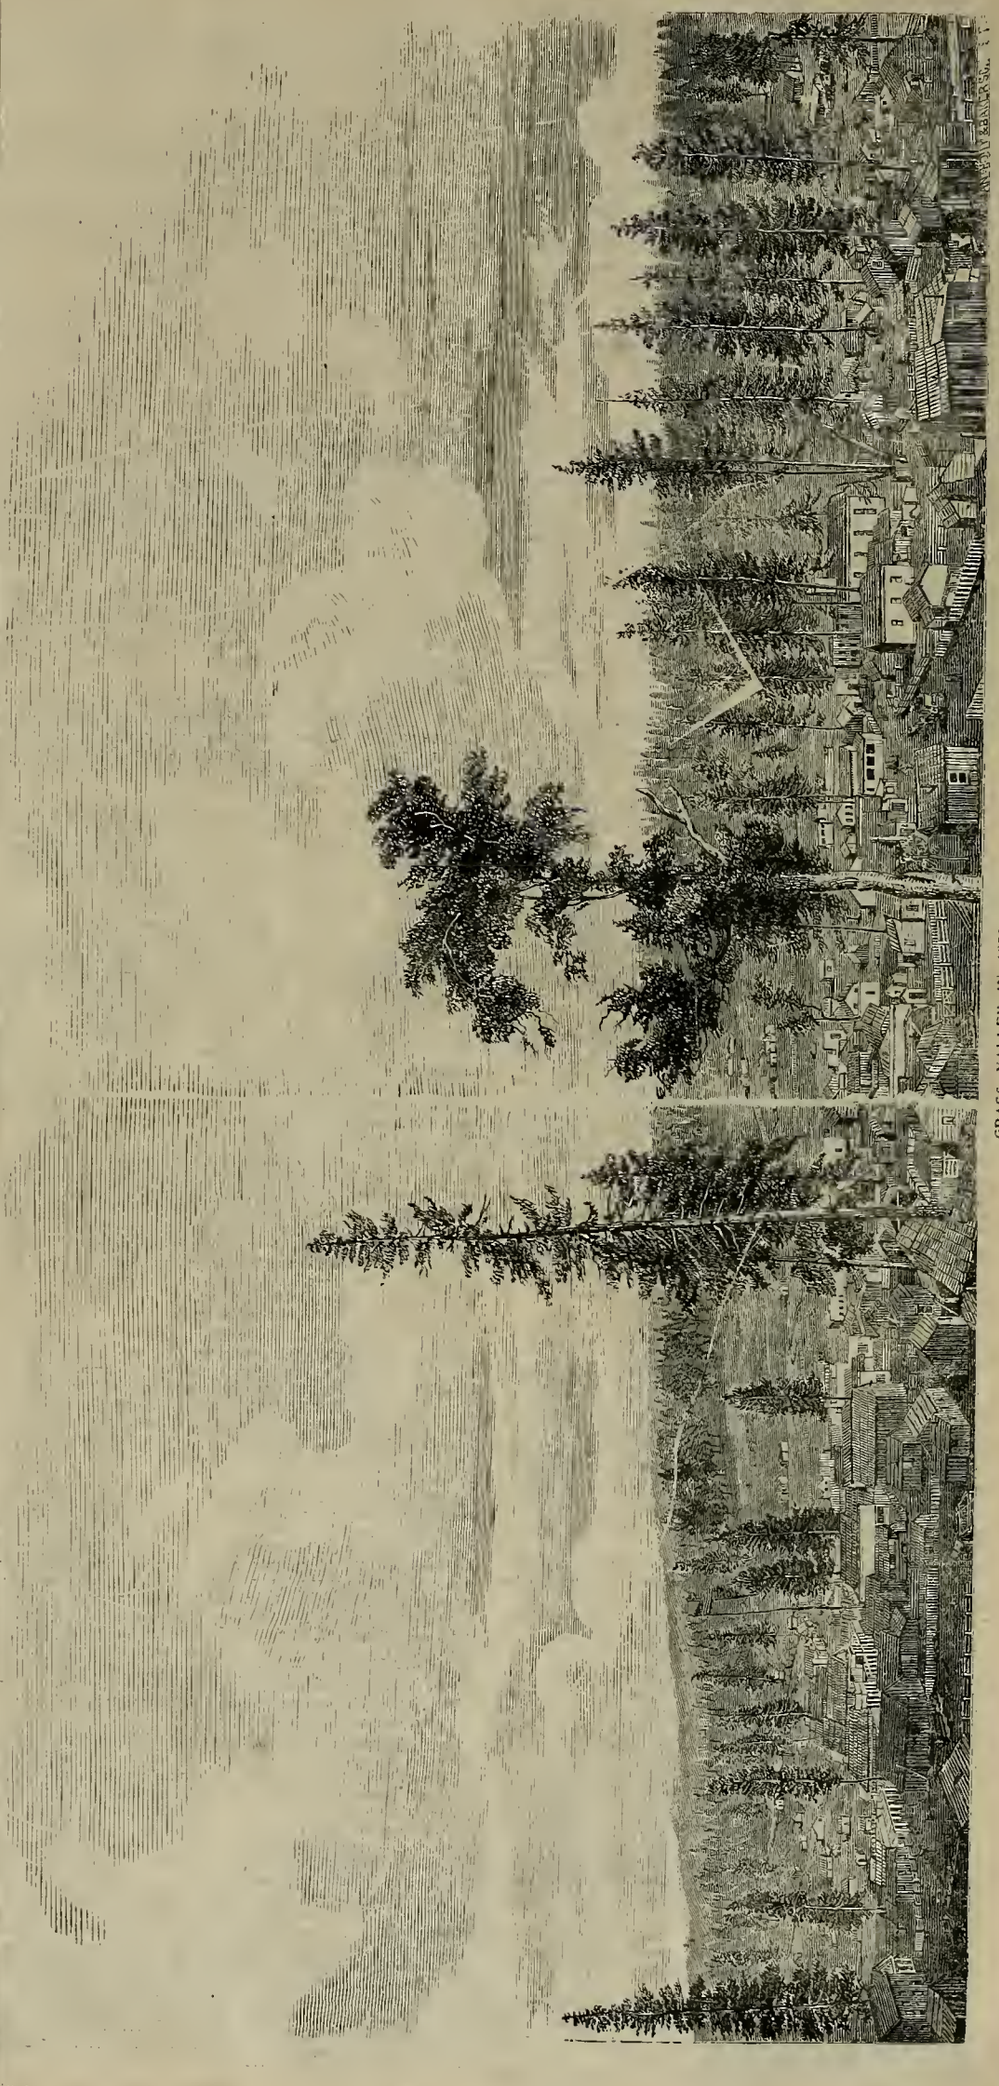
The Agua Fria Compauy also sent out a small sawmill to cut all the necessary lumber, also a cupola furnace to make any castings required. The first shoes aud Cornish pump in the State were cast by it, as well as four Chilean mills. The fire-bricks and Stourbridge fire-clay, to build a furnace for the roasting of pyritic matter, were all imported from England.

The system of milling in vogue then, as described by Mr. Atwood, will iuterest the mine owners of today, iu view of the results attained. The rock was first spalled (*i. e.*, beaten with hammers); theu passed through the Cornish rolls, like the rock breakers now in use, after which it was passed to the stamps. The screens used were puuched copper plates and brass wire, the aperture being about the same as a twenty-four mesh. The pulp from the mortars was then allowed to pass from the blanket trays, of which there were three to each mortar, in three lengths of about five feet each and sixteen inches wide, the angle of which could be raised or lowered by lever to suit the rock being treated.

The blankets were in three-feet lengths. At first bed blankets were used. Afterwards the company got the San Francisco Woolen Mills to make them of coarse wool with the nap only on one side. The pulp was then delivered equally against a board by distributors and made to strike the blankets at right angles, by which means the heavier bodies were retained in the coarse nap. Three sets of trays were used, so that two were always in place, while the third was being washed. The time for washing the blankets was from one-half hour to two hours, according to the richness of the pulp.

The pulp, after passing over the blankets, was run into tye-bundles, drawings of which will be seen in Phillips' "Mining and Metallurgy of Gold and Silver." The pyritic matter collected ou the blankets aud from the tye-bundles was afterwards passed through Atwood's amalgamator, which collected nearly all the free gold. The amalgamator had uuder the three pools of mercury an arrangement so that a jet of steam kept the temperature at about ninety degrees. The pyritic matter was then roasted in a furnace, put up at the time the mill was built. The roasted matter was then amalgamated in a Chilean mill, constructed for the purpose.

The following tabular statement, taken from the



GRASS VALLEY IN 1853.

books of the old Gold Hill Mining Company, shows the results of the milling of custom rock at that mill during the year 1856, which was brought from most of the mines then being worked near Grass Valley:

Mine.	*Tons.*	*Per Ton.*
Missouri Hill	72	$40 00
Missouri Hill	33	23 00
Missouri Hill	20	25 00
Missouri Hill	110	26 00
Missouri Hill	76	25 00
Sebastopol.	27	111 00
Sebastopol.	30	60 00
Sebastopol	21	30 00
Houston Hill	22	60 00
Allison Ranch	21	370 00
Gold Hill	11	117 00
Gold Hill	7	117 00
Gold Hill	226	23 00
Gold Hill	7	63 00
Gold Hill	7	40 00
Gold Hill	19	28 00
Gold Hill	61	40 30
Gold Hill	157	50 00
Osborn Hill	5	60 40
Ophir Hill	57	180 00
Massachusetts Hill	40	28 00
Rose Hill	120	23 00
Ridan Hill	39	28 00

The following results were obtained from the same class of ores worked at the French mill, owned by Messrs. Fricot & Co.:

Mine.	*Tons.*	*Per Ton.*
Ophir	140	$94 43
Sebastopol.	263	39 00
Wisconsin	58	45 12
Rich Hill.	40	34 00
Massachusetts Hill	34	90 00
Massachusetts Hill	90	118 00
Massachusetts Hill	17	140 00
New York Hill.	40	85 70
Mt. Hope	2,000	$55 to 60 00

The State Agricultural Society in 1858 sent several competent experts to examine all the gold quartz mills in California, and, after a thorough investigation, awarded to the twenty-one-stamp mill erected in 1853 the first premium, a gold cup for the best quartz mill in the State, and a silver medal for the best amalgamator and gold-saving washing machine.

The stamps brought out from England were made from forged scrap iron and fitted into wooden stems, and when they were worn out, wrought iron stems with sockets and cast iron shoes were used. The first Cornish pump and Chilean mill were cast by Mr. William Watt at the Gold Hill mill, and Mr. T. Giles, now of Nevada City, cast the sockets and shoes.

In June, 1859, the furnace at the mill was being used for chlorination works, with not very satisfactory results, but the first assay of silver from the Comstock ore was made by Mr. Melville Atwood, which was $876 per ton for gold and $3000 for silver. The piece of rock from which this assay was made was brought from the Comstock by Mr. B. A. Harrison and taken from the croppings of the Ophir lode.

The Agua Fria Company, which was originally formed to work a number of mines in the old Fremont grant in Mariposa county, served to create in rather strange manner one of the landmarks on the Sacramento river. Mr. Atwood is again authority for the story. It appears that the company sent out to California a number of engines and supplies of all kinds required in mining. When they arrived at San Francisco there was no warehouse to put them into, so they purchased an American bark, the Charleston, and stored them in it. The bark was towed up to Sacramento in February, 1853, and, after discharging the machinery and supplies for the Grass Valley mines, remained for some time there; she was then ordered back to San Francisco. The gentleman in charge thought he would pay all expenses by taking a cargo of cordwood from the Ironside ranch.

Owing to the upper works having been exposed to the sun while lying at Sacramento, when she reached deep water the bark leaked so badly that she sank and nearly everything was lost. Any property recovered from the wreck cost nearly as much as the original price paid for it. The vessel finally had to be blown up, and made what was afterward called the "Hog's Back" on the Sacramento river.

The original incorporators of the Agua Fria Company have passed away long ago, and the mines they owned have passed through the hands of many proprietors.

The cut is furnished by Mr. W. B. Ewer, of the MINING AND SCIENTIFIC PRESS, another honored pioneer, who started the first newspaper ever published in Nevada county.

RAYMOND GRANITE QUARRY, MADERA COUNTY.—*See page 357.*

Recent Decisions.

The Supreme Court of the United States has, in case of Joel Parker vs. Frank O. Taylor, held that where, on the records of the local land office, there is an existing claim on the part of an individual to land within a railroad grant under the homestead or preemption laws, which have been recognized by the officers of the government and has not been canceled, the tract is excepted from the operations of the grant.

Mineral.—The mineral value of a vein is not established by an ordinary assay certificate.

Oil land may be located under the mineral laws. Proof that neighboring lands contain oil is not sufficient to defeat an entry of land returned as agricultural.

Mineral locations prior to survey are not in conflict with reserved school sections.

A failure to comply with local regulations is a matter for protest or adverse suit.

Mineral land will not pass under a townsite patent.

Mineral land must be shown as a present fact.

Best to Advertise in.

A man who subscribes for a trade paper does so, not only because he is alive to the interests of his trade in general, but because he expects to find in it—and generally does—information and suggestions of value in the conduct of his own business. Such a man reads his paper from end to end, advertisements and all, commenting as he goes along. Many things are jotted down in his memo. pad for every day use, as well as inquiring further into on his first visit to market. And as it is necessary for a man to be wideawake nowadays in order to succeed in business, these are the men who subscribe for their trade journal, and are the advertisers' best patrons. They cannot afford to pass anything which promises help or suggests additional profits. Hence, the trade journal is the best medium for advertising things which concern the business man.—Newspaperdom.

A MAN who enlists in the United States army loses his right to appeal to the civil courts against the decisions of military tribunals by which he may have been tried. This is the decision of the United States Supreme Court in the case of a soldier who was tried by court martial, and who sought the civil courts for relief. The case has aroused much interest among military men, both officers and privates. It is the general opinion that the denial of appeal to the civil courts is the only means of maintaining any discipline.

Mining Under the Sea.

At Betallack, near Cape Cornwall, a striking example is seen of man's boldness in searching for wealth and his skill in securing it. Betallack is a bold headland, composed of huge masses of hornblende, masked by walls of slate, against which the Atlantic surges are constantly dashing. But the persevering efforts of man have at this point been more powerful than those of nature. Gloomy precipices of slate, which unnumbered ages of sea storms have been unable to displace, are here cut in twain by the miner, whose complicated machinery clings to the cliff at places where it would seem almost impossible for an engine to be fixed. Powerful steam engines, stamp mills, and all the heavy machinery required in modern mining are perched on what at first sight seem inaccessible situations, so that from a distance they look as if growing out of the crags. All is noise and bustle, which contrast strangely with the placidity of the seaward view. "Kibbles" descend fathoms beneath the sea, and ascend again with copper or tin ores, which are wheeled away to larger heaps, where women, boys and girls separate various qualities with the systematic industry of workers in a factory. Everbody and everything—rocks, platforms and paths—are smeared with the prevailing red hue derived from a slight mixture of iron with copper or tin ores, and then the very muddy stream flowing from the stamp mill to the sea has imparted to the beach, the breakers and the foam the same rubicund tinge. If ore is coming up plentifully and of good quality, everybody is pleased, and far down in the gloomy depths of the mine, which Cornish legends people with spirits, the news that a new "bunch" of copper has been struck, or that the old lode is growing richer, fills the workers with professional joy. As the visitor creeps along the passages into which the light of day has never entered, he hears comparatively little, until, having become accustomed to the darkness barely illuminated by the flicker of lamps, he dimly distinguishes the stalwart gnomes at work. Coming from the upper world amid the din of heavy stamps and measured gush of pumps, the clang of machinery above and the surge of the sea below, the rattle of wagons on tramways, and the crowds of men and boys climbing up and down paths which seem too steep for a goat, the modified silence of the level strike sone as unnatural. In places, however, the guides may ask the visitor to listen to a curious sound. It is the booming of the waves above, and the grating of the stones on the sea bottom. Then he is told, to give him courage, that in some of the recesses of the first level the ore has been cut away until a roof not more than six or eight feet thick has been left. First worked on the face of the cliffs only, the mines descended, level by level, until the excavations extended for more than six fathoms under the sea, and for long distances inland, while the greatest depth to which it had been sunk is about 2000 feet.

THE following recipe for artificial stone is given by *Diamant:* Four parts of finely powdered glass is stirred in warm water containing a little hydrofluoric acid for a couple of hours, then nine parts sand and five parts caustic soda are added and the whole thoroughly mixed and poured into molds. After two days, the blocks are taken out of the molds, dried for three days in open air and then subjected to the influence of a one per cent solution of fluoride of sodium for ten days. The stones are washed off and are then ready for use.

ASBESTOS PACKING for valve stems and similar purposes is much improved for use by oiling it well with cylinder oil before putting it into place.

Compressed Air versus Electricity.

To the Editor:—The *Pacific Coast Electrician* of May, 1895, prints an article entitled, "Compressed Air versus Electric Power Plants for Mining Purposes," written by Mr. A. M. Hunt. This article analyzes in detail an article by Mr. E. A. Rix, printed in the Mining and Scientific Press of May 18, 1895, entitled, "Notes on Recent Compressed Air Plants."

As Mr. Hunt suggests, Mr. Rix wrote this article from the standpoint of a special advocate of compressed air machinery, but dealing merely with current news, and it was not aimed at a scientific discussion of compressed air versus electricity. Mr. Rix does not profess to be an electrical engineer, and, as Mr. Hunt's observations clearly indicate, he is not familiar with recent developments in compressed air engineering; therefore we think the public might find a discussion between us more interesting if we confined ourselves individually to our own specialties. We therefore suggest the following problem to Mr. Hunt, with the request that he publish the calculations and estimates for an electrical transmission at his earliest convenience. We will follow with a compressed air transmission, covering the same requirements. The problem is as follows:

There is a mine, of magnitude, which has outgrown its steam plant and desires to bring power from a source four miles distant, over an entirely feasible and accessible line. The source of power may be either water or fuel, and the cost of either the water or the fuel is one cent per horse power per hour. There would be required at the mine the following motors, either air or electrical:

One motor delivering 100 brake H. P. to a hoisting apparatus.

One motor delivering 100 brake H. P. to a stamp mill.

One motor delivering 125 brake H. P. to a Cornish pump.

One motor on the 1500-foot level to deliver 25 brake H. P. to an auxiliary pump.

One motor on the 1500-foot level to deliver 25 brake H. P. to a winze hoist.

There will also be required 1500 cubic feet of free air per minute, compressed to 80 lbs., for running rock drills and veutilatiug purposes; also electricity for 250 incandescent lights.

Required: The total brake-horse power to he delivered from the shaft of the prime motor to accomplish this result; also the cost of all the machinery and appliances included between the prime motor and the machinery to be driven at the mine.

These requiremcnts are very similar to those at the Maryland mine, Grass Valley, and therefore cannot be considered unique.

We would suggest that the cost of transmission and of the differeut generators and motors and of the erection, etc., be fully itemized, and let us say that the mine is located at Grass Valley.

Calculations are to be given full enough for comprehension and the efficiencies throughout the system plainly shown and reference given to authorities or tests, where possible.

Mr. Hunt may consider in this problem that the introduction of compressed air for running rock drills is an unnecessary requirement, inasmuch as it might be possible to run rock drills by electricity. We have taken the precaution in this matter to ask the General Electric Co. and the Electrical Engineering Co., the only two concerns here who have been interested in electric rock drills, regarding the status of these drills at preseut in the market. They permit us to state as follows: The General Electric Co. state that they are not in a position to furnish these drills at present. The Electrical Engineering Co. state that they have expended thousands of dollars trying to perfect an electrical rock drill, and the result has been an absolute failure. Upon inquiry we do not find that there is a mine in the State using electric rock drills; consequently, inasmuch as we are considering a mining transmission, we think the requirements stated in the problem are proper.

It is understood, of course, that the efficiency of whatever electrical machinery we may use in our transmission, or whatever pneumatic machinery Mr. Hunt may use in his electrical transmission, shall be calculated at the per cent which we are perfectly satisfied to allow.

Referring to Mr. Hunt's article, where he speaks of slide valve engine economies, he has evidently misunderstood Mr. Rix's meaning, for the latter referred to plain side valve engiues requiring from thirty to sixty pounds of water per horse power hour, in comparison with the various Corliss types using from fourtcen to twenty-eight pounds. Mr. Rix is perfectly aware that there are automatic cut-off engine builders who make guarantees equal to the Corliss, and he is also aware, from an article published in *Industry* of May, 1895, that Mr. Parsons' steam turbines are delivering a killowatt on a consumption of fifteen pounds of water per hour, which is equivalent to between eleven aud twelve pounds of water per horse power hour—a result as yet impossible with reciprocating engiues. Yet these high rotative types are not adapted to compressing air, and consequently he spoke of the Corliss type only as exemplifying high economy in connection with air compressors.

Speaking of compressed air transmissions, we note in the Mining and Scientific Press of last week that a large engineering concern in the East had contracted with the Delaware, Lackawanna & Western Railroad to furnish a compound air compressing plant, driven by cross compound condensing Corliss engines, transmitting air at 110 pounds to the square inch for 3800 feet, to actuate with a guaranteed efficiency of ninety per cent a compound pneumatic engine, which in turn drives two differential pumps. This ninety per cent evidently is the ratio between the indicated horse power of the steam engines which drive the air compressors and the indicated horse power in the air motors, and if the results fulfill the guarantee, what is there in the shape of a transmission that can do any better?

Yours very truly,
Edward A. Rix,
A. E. Chodzko,
Compressed Air Engineers.
226 Market St., San Francisco, June 6, '95.

Increased Production of Gold.

The Director of the Mint has just issued his estimate of the production of the gold and silver mines of the United States. The statistics presented by him will be received with special interest, in view of the discussion upon the monetary question which has been sprung recently, and which may be said to be now in full swing. The amount of gold produced and its coining value are given in the following table:

AMOUNT AND VALUE OF GOLD PRODUCTION.

State or Territory.	*Fine ounces.*	*Value.*
Alaska	53,888	$ 1,113,330
Arizona	86,324	1,784,475
California	656,468	13,570 397
Colorado	459,152	9,491,514
Georgia	4,726	97,756
Idaho	100,682	2,081,281
Michigan	2,150	44,444
Montana	176.637	3,651,410
Nevada	55,042	1,137,819
New Mexico	27,465	567,751
North Carolina	2,254	46,504
Oregon	60,792	1,422,056
South Carolina	4,735	97,830
South Dakota	159,594	3,290,100
Utah	41,991	868,031
Washington	9,438	195,100
Ala., Md., Tenn., Va., Vt., Wyoming	1,495	30,903
Totals	1,910,815	$39,500,000

The amount and value of the silver production of the mines of the country are given in the following table:

AMOUNT AND VALUE OF SILVER PRODUCTION.

States or Territories.	*Fine ounces.*	*Coining value. (measured in gold.)*
Alaska	22,261	$28,782
Arizona	1,147,304	1,483,254
California	717,368	927,506
Colorado	23,281,399	30,101,303
Georgia	325	420
Idaho	3,288,548	4,251,860
Michigan	35,122	45,410
Montana	12,820,081	16,575,458
Nevada	1,035,151	1,338,377
New Mexico	632,183	817,368
North Carolina	352	455
Oregon	26,171	33,837
South Carolina	305	394
South Dakota	58,973	76,248
Texas	429,314	555,073
Utah	5,891,901	7,617,812
Washington	113,160	146,308
Ala., Md., Tenn., Va., Vt., Wyoming	182	235
Totals	49,500,000	$64,000,000

The figures given, says *Bradstreet's*, present at the outset one notable point of interest. It is this—that the production of gold in 1894 was the largest for any year since 1878, being worth about $3,500,000 more than that for the preceding year. The production of silver showed a decrease of about $10,500,000 as compared with the preceding year. In short, while silver production has been falling off, gold production has been increasing—a fact which goes to show the groundless nature of the fear that the supply of gold will sink below the normal requirements of commerce.

California and Colorado hold the lead as producers of the precious metals. California led in gold production with a total quantity of 656,468 ounces and a value of $13,570,397. Colorado comes next with a total quantity of 459,152 ounces, valued at $9,491,514. Montana, South Dakota, Idaho and Arizona followed in the order named. In silver production Colorado led all the other States, turning out 23,281,399 fine ounces of the coining value, measured in gold, of $30,101,203. Montana came next with 12,820,081 ounces of the coinage value of $16,575,458. Utah came next with 5,891,901 fine ouuces of the coining value of $7,617,812; Idaho next with 3,288,548 ounces of the coining value of $4,251,860; Arizona next with 1,147,204 fine ounces of the coining value of $1,483,254 and Nevada next with 1,035,151 fine ounces of the coining value of $1,338,377. At the average price of silver for the calendar year 1894—$0.635 per ounce—the commercial value of the silver product of the mines of the United States was $31,432,500.

The figures for the gold and silver production of the world are incomplete thus far, but so far as received they show an increase in the production of gold over 1893 of about $21,000,000, the largest increases being in Africa, which has $9,600,000, and Australia $6,000,000, followed by the United States with an increase of $3,950,000. Australia leads the list of gold-producing countries for 1894 with a production of $41,000,000, the United States taking second place. The product of silver in the world, it is estimated, will be from 145,000,000 to 150,000,000 ounces for the calendar year 1894. The heaviest falling off in the production is in the United States, followed by Australia, Mexico showing a gain of 2,700,000 ounces. Mexico shows a gain in gold production of about $1,500,000.

Coast Industrial Notes.

—It is proposed to bond Oakland for $3,000,000 at 4 per cent for forty years for municipal improvement purposes.

—The San Francisco Bridge Co. has a contract to furnish a 24-mile pipe line for the Portland, Or., water works; the price is $460,000.

—The Joshua Hendy Machine Works is sending a 20-stamp mill to the Mammoth mine, Tuolumne Co., and a similar one to Congress, Arizona.

—C. B. Hanson, resident representative of the E. P. Allis Co. of Milwaukee, Wis., has moved his headquarters tbis week to No. 9 Fremont St.

—The Union Gas Engine Co. is finishing four engines—a 20 H. P. for a fruit schooner, a 35 H. P. for the Wilmington Development Co. and two 20 H. P. for bay schooners.

—Francis-Smith & Co. have a contract with the Horsefly G. M. Co. of Cariboo, B. C., for steel pipe sufficient to thoroughly work the company's 360 acres of placer ground.

—It is reported at Colon that the new French company, which has been pushing the work along the route of the Panama canal, is trying to sell the canal to an American syndicate.

—The Consolidated Water Co., of San Diego, comprising the San Diego Flume Co. and the San Diego Water Co., has placed $1,200,000 of its $2,000,000 5 per cent. bonds in English hands.

—Two 600-H. P. electric generators and a 1200-H. P. triple-expausion engine form a part of the new equipment for the Market St. Ry. Co., of this city, under the direction of the Union Iron Works.

—Moran Bros., of Seattle, Wash., have built and delivered three 42-inch centrifugal pumps and upright engines for the Government dry dock at Port Orchard. They bave a pumping capacity of 110,000 gallons per minute.

—The Manufacturers' Association have made appropriate showing to the powers that be regarding the roof of the new union depot that it should be of fine California slate, than which there is none better, rather than imported galvanized iron.

—The Willapa, Wash., *Pilot* states that iron works will be put in New Ilwaco for the manufacture of iron from the great quantities of black sand there. It is said that 1400 pounds of iron can be secured from a ton of the sand by a new chemical process.

—The San Francisco and San Joaquin Valley Railway has paid J. F. Merrill $42,000, the third installment of the payment for the rails ordered. There are now afloat on their way bere 5,500 tons of rails. It is thought that the new road will begin to lay track by July 1st.

—The two sets of hoisting engines building at the Union Iron Works for the Anaconda copper mines attract considerable attention. The greatest mines of their kind in the world naturally require the most powerful hoisting machinery, and the plant now heing constructed is planned to meet every requirement.

—A big wheat deal was consummated last Monday by the payment to the special administrator of the Fair estate of $3,053,200 for 179,600 tons of wheat at $17 per ton. George W. McNear took 60,050 tons; Eppinger & Co., 57,450 tons; Balfour, Guthrie & Co., 50,050 tons; and Blum, Baldwin & Girvin, 12,500 tons.

—The Pacific Coast Borax Co. is now producing that article from deep, rocky stratifications of borate of lime. Thirty years have made a wonderful difference in the product and price. In '64 the output was 25,000 pounds, New York wholesale price 40c; in '94 the output was nearly 13,000,000 pounds, New York wholesale price 7c.

—The San Francisco Gas Light Co. has finally decided to put into practical shape its long-cherished project of erecting an electric plant to furnish light and power. Pres't J. B. Crockett says the cost will be over $2,000,000, and the outfit will be a California product as far as possible. The probable location will be at Tehama and Fifth streets.

—The California Telephone and Construction Co. announce their ability and intention to establish telephone lines in Sacramento, San Jose, Los Angeles, Fresno, Santa Cruz, Placerville, Oakland and Stockton, and say that they will cut rates so that the telephones now costing $4 and $5 will be had at $2.50 per month, and residence telephones for $1.50.

—The California Wire Works has a $75,000 contract to put in four and one-half miles of tramway from Nelson, B. C., to the Silver King mine. The work is to be finished Sept. 30, '95. The carrying capacity of the tramway, when finished, will be 100 tons of ore every ten hours, which will be delivered at the depot of the Nelson & Fort Shepard Railway.

—Macaroni is made of wheat. We have so much wheat that we bave been feeding it to the American hog. But in spite of this we bought last year over $3,000,000 worth of macaroni from a single district in Italy. It gave work to hundreds of men in that district. But why should the work not have been done in America from American wheat by American workmen for American wages?

—*Wood and Iron* reports the total receipts of lumber for May to be 25,506,746 feet, as against 33,415,436 for May, 1894, a falling off of 7,908,690 feet. The receipts of pine and spruce in May, 1894, were 23,893,102 feet, and in May of this year 15,836,419, a falling off of 8,056,683 feet. Humboldt county increased a small amount, as in May, 1894, she is credited with 2,687,291, and in May, 1895, with 3,270,235, an increase of 582,944 feet. Mendocino in May, 1894, had 6,242,043 feet, as against 5,857,102 in May, 1895, a falling off of 384,941 feet.

—The June number of the Consular reports on "The Oriental Market for Dairy Products and Fruits" is received. Consul Read, at Tien-tsin, says the markets which exist among the foreign residents are supplied by California, a very small amount of European products being supplied. The Consul at Bombay says that California canned fruits and preserves are considered the best in the market and are by far the cheapest. Consul Smithers, at Osaka and Hiogo, says a great amount of butter is shipped yearly from California in tubs, and that there is a great demand for it because of its purity. A large quantity of preserved and dried fruit, he says, was imported last year from California, dried prunes and apricots being sold hy all the principal grocers, and being in much favor, particularly the latter. Consul-General Barrett, at Siam, says there is a great market for the products, not only of California, Oregon and Washington, but of all the United States. Nearly all the wheat flour, says Consul-General Pratt, at Singapore, comes originally from San Francisco, but the bulk of it is purchased for the Straits market at Hongkong. Over 900 tons were imported in 1893. The Consul at Auckland reports that the total quantity of canned goods imported last year was nearly 900 packages, of which quantity the United States contributed over three-fourths. All the dried fruits, says the Consul, come from California, and these products are used exclusively.

Scientific Progress.

Scientific Food Preparation.

The United States Department of Agriculture could not have been in better business than it was when it caused to be prepared and circulated a bulletin on the subject of food preparation. Our enthusiastic poet statistician, Edward Atkinson, in this bulletin skips joyously to the fore with his Aladdin oven and his oil lamp heater and cooker, enabling a poor man to prepare a dinner fit for the gods at an outlay of a few cents. Atkinson's part of the work shows what every cook who has any sense already knew—that in order to get the best results most kinds of food must be subjected to a moderate heat a very long time instead of a fierce shriveling heat for a short time. But very few cooks have any sense in this respect. The pamphlet contains illustrations of cooking tables and boxes that prepare delicious food with the heat only of a little kerosene lamp.

Mrs. Ellen H. Richards furnishes to the pamphlet what, if one were speaking of live-stock feeding, he would call a "balanced ration." And, indeed, no living creature needs a balanced ration more than civilized man does all over the world to-day.

The proper food to keep a human being in health must contain so much carhohydrates or starchy matter. We all knew that before, but the trouble was with the scientific that in their eagerness to lug in this and other fine big words they never told us in what foods we could find our carhohydrates. This Mrs. Richards does. Heat is wanted, and for this purpose fats and oils are necessary. Muscle-building food is wanted too. The food for this purpose contains much "protein," which is the name given to the muscle-building nitrogenous compounds.

Mrs. Richards gives the "balanced ration," which, in the latest scientific view, furnishes all these substances to one person for a week. Her table is as follows, not counting drinks, such as milk, cocoa, coffee, etc.:

	As bought, pounds	Nitrogenous substances, pounds	Fats, pounds	Carbohydrates, pounds
Meat or meat substitutes	3	.40	.20	....
Flour and grains	5	.60	.05	3.50
Butter	0.8	.....	.70	....
Sugar	1	.....	....	.90
Vegetables, including potatoes	5	.06	.12	.60
Fruits	3	.01	....	.20
Total		17.8 1.07	1.07	5.20

The dish that comes nearest to being wholly digested is one made of cornmeal and cheese cooked together. Ninety-three per cent of it is digested. In a dish made up of pea flour cooked with milk, butter and eggs 92 per cent is digested.

Nearly Six Miles Above the Earth in a Balloon.

A record-breaking voyage made hy Dr. A. Berson in the halloon ship "Phœnix" is described in the *Journal of Aeronautics*. The halloon started December 4th from Stuttgart, Germany. It was charged with 2000 meters of hydrogen gas, and amply supplied with instruments for registering wind velocities, temperature and harometric pressures. In a quarter of an hour after the start the halloon had risen to 2000 meters (6500 feet), and in an hour to 5000 meters or 16,000 feet, the thermometer registering 18° C. below zero (0° F.). In less than two hours the hold aeronaut was carried to 26,000 feet, or to au elevation exceeding all mountain summits, with the exception of the loftiest of the Himalayas. The thermometer at this point marked —39° C. (—38° F.), or very nearly the lowest that had been recorded on any mountain top (the winter temperature of the summit of Mount Ararat, as reported hy General Venukof). Neither the rarified atmosphere nor the cold seems to have materially interfered with the intellectual processes of the acronaut, who, however, was forced to a close communion with the oxygen hags. When ceasing for a few seconds to hreathe from these hags, Dr. Berson felt dizzy and dangerously weak, hut only once dip his eyes close against himself. In two and a half hours after the start the adventurous scientist reached the highest point of his journey, 9150 meters (30,012 feet), an elevation almost exactly 1000 feet above the summit of Mount Everest. At this prodigious height, where the harometer registered an atmospheric pressure of only 231 millimeters, or 9.09 inches, careful readings of the instruments were still made, and the condition of the observer was such that seemingly he might have ascended much farther. The temperature in greatly attenuated atmosphere was —47.9° C. (—54° F.). For a full hour after the "highest" was reached, two of Dr. Berson's fingers remained frozen, hut heyond this comparatively little discomfort was experieuced. The descent was made in slow calculated curves, with final arrival on a stuhble-field at Schoenwald, near Keil. Among the interesting results of this atmospheric exploration were the determination of humidity in the highest zones, the snow-flake structure of cirrus clouds, a tremeudous increase of wind velocity with the ascent, and the great lowering of winter temperatures hetween 5000 and 30,000 feet.

Mechanical Progress.

Gas Motor Street Cars in Germany.

Outwardly, the appearance of the cars is precisely similar to that of an ordinary douhle-decked horse car, having stairways from each platform to the seats on the roof. All the machinery is inclosed and coucealed from sight; there is no smell of gas, uo noticeahle heat from the engine, and no undue noise or jar wheu the car is stopped or set in motion. The motor is a double-cylinder gas engine of the Otto model, placed under the seat at oue side of the car, and reached, for purposes of oiling, cleaning or repairs, hy doors which form panels iu the outer wall of the car. When closed, they arc not noticeahle. The gas charge is ignited at each stroke hy an electric spark from a small hattery located in the engine space, so that the car is put into or out of service hy turning a knoh which opens or closes the battery circuit.

The engine is kept in continuous motion while the car is in service, and the whole is managed hy the driver on the front platform.

The gas supply is carried in three cylindrical reservoirs of boiler iron, ahout ten inches in diameter, two of which are hung trausversely under the floor at each end of the car, while the third is placed heneath the seat at the side opposite the engine. The three reservoirs weigh, together, about 550 pounds, and contain 33.5 cuhic feet of gas, compressed to a pressure of eight atmospheres hy means of an ordinary force pump at the end supply station.

A fourth cylindrical reservoir, containing water for cooling the engine cylinders, is placed heneath the douhle seat along the middle of the deck roof, whence the cool water descends and the warm ascends automatically through concealed copper tuhes, so effectively that the water, heing continually cooled in the exposed reservoir, is used over and over again, aud keeps the cylinders down to the requisite temperature. The ordinary car is equipped with a gas engine of nine horse power and carries thirty-six passengers, viz., fourteen seated inside and twelve on deck, with platform standing room for ten more. The larger cars, capable of hauling a trailer during hours of heavier traffic, have twelve horse-power engiues.—Frank H. Mason in Cassier's Magazine for June.

A New "Natural" Method of Wood-Preserving.

Hitherto, the seasoners of wood have relied almost entirely on the extraction of the sap, either hy the natural process of dessication by time aud exposure to the air, or by some artificial process, such as kiln-drying, steamiug, washing, etc. In the curing of timber by the extraction of the sap, a great proportion of the material is depreciated by reason of sun-shakes and cracks, or hy warping, twisting, shrinking and other similar evils. To these objectious may be added many others of a serious nature from a comercial point of view, such as waste of time iu seasoning, necessity to hold large stocks, unproductive outlay of capital, loss of interest, rent, taxes and insurance, risk of destruction, deterioration in quality, expense of priming and filling, shrinkiug of knots and liahilitiy to rot and decay. It is proposed to take a short cut of all this costly tangle aud trouble by simply emulating nature, aud retaining within wood its sap or "life-blood." This, Colonel Haskins, the inventor of the new "natural" wood-preserving process, maintaius, is the only true principal of wood-preservation. The sap should be treated so that the whole of its life-preserving properties are retained and solidified within the substance itself. The sap of wood contains large proportions of certain alhuminous, glutinous, resinous aud olcagiuous compounds in a state of solutiou, and it is of these compounds that nature, iu the growth of the tree, by her laws of heat and pressure, gradually creates the hard, sound, fibrous portion of the wood. The new process is to take the wood in its green state and so treat it with air pressure aud great heat that the various compounds in the sap are distilled and retained within the wood, without losing their antiseptic and preservative properties. The various essential compounds become coagulated in the pores and impregnate the whole suhstance. The soluhle sap becomes insoluhle, binding the fibers, and forming a homogeneous mass incapable of absorhing moisture, impervious to atmospheric change, unshrinkahle, easily worked and practically indestructihle. Thus the process clinches in a few hours what nature has taken years to effect.

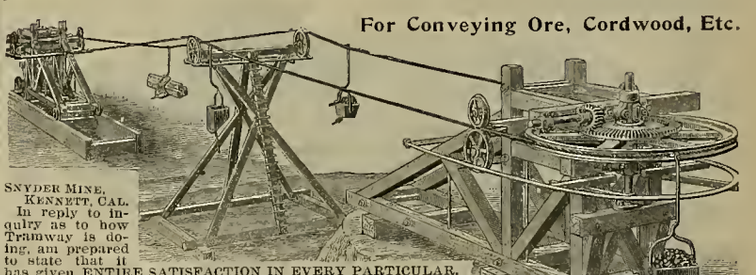
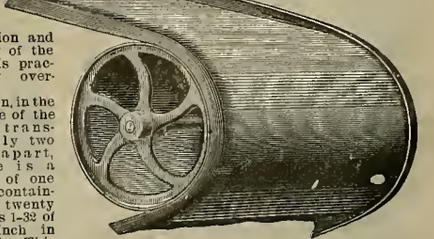
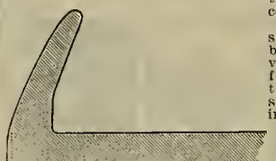
VULCAN WIRE ROPEWAY
For Conveying Ore, Cordwood, Etc.



SNYDER MINE, KENNETT, CAL. In reply to inquiry as to how Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR.
JUDKINS TRAMWAY CO., POMEROY, WASH. It will give us great pleasure to recommend your Ropeway and your Company as well to any persons who may be thinking of erecting Ropeways.
SAN ANDREAS, DURANGO, MEXICO, March, 20, 1894. I desire by this letter to testify that the Vulcan Wire Ropeway furnished to this Company by your Works, and erected by your engineer, B. McIntire, is of the very best class, and has given us entire satisfaction since its installation.
ANTONIO H. PAREDES, Director S. A. de la S. M. Co.
Vulcan Iron Works,
135-145 Fremont St., San Francisco.

Blasdel Improved Concentrating Belt.
We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.
Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.
Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.





H. G. BLASDEL, JR., Manager,
419 California Street, Haywards Building.....San Francisco.

Electrical Progress.

Will Ten Volts Kill?

An important issue has been raised by a correspondent in the colnmns of a contemporary. One of the laborers in a mine was killed by an electric shock received while handling an electric mining machine, notwithstanding the fact that the electromotive force on the circuit did not exceed 280 volts. The yonng man was strong and well built, and a post mortem examination by physicians showed that the brain and heart, and indeed the whole body, were sonnd, and there were no marks to indicate the cause of death. Richard Lamb, whose pioneer work in electrical logging is familiar, states that too much publicity cannot be given to the fact that even 110 volts will kill, if applied to a bleeding sore, and allowed to remain a few seconds. The fact that 110 volts does not paralyze the nerves, and that therefore the contact can almost invariably be withdrawn at once, is the reason why there arc so few records of death, if any, by that voltage. With 280 volts in contact with a bleediug sore upon the hand, a person would be killed almost instantly. Blood is a good conductor of electricity, and the current would be transmitted at once to the heart. For this reason, Mr. Lamb requires all the men operating his logging and electric canal boat towing cableways to wear rubber gloves to prevent the possibility of contact with a sore, although he uses only 220 volts. Mr. Lamb says he was assnred by Nikola Tesla that ten volts applied to a bleeding sore on the hand would pnt a man to sleep. Another correspondent believes that the laborer died from fright, and relates how a party of persons having no knowledge of electrical apparatus visited his laboratory to experience the novelty of receiving a static discharge. A harmless shock was administered to each. Where it was unexpected the persons nearly swooned from fright, while those expecting it made not the slightest demonstration. Those so badly frightened at first received afterward a much greater discharge without flinching. One lady picked up a pair of carbons carrying 276 volts, and, after holding them for a while, threw them down with an exclamation of impatience, but without being impressed with the heaviness of the shock.

The Powerful Fire Island Light.

Work on the new electric lamp for the Fire Island light has progressed so far that it is expected that it will be lighted for the first time on July 1.

The new light will be the most powerful coastline illnminator in the world, and the reflection of its five-second flashes on the sky will be observable at a distance of twenty-five miles out to sea,

The light will be 50,000,000-candle power, and this will be increased by the lens to 250,000,000-candle power.

Thc lens was made in France, and is what is termed a bivalve lens, being in two halves, like the shells of an oyster. There is sufficient space between the convex halves of the lens to admit the body of a man. This is necessary, in order that the carbons and other apparatus between the halves of the leus can be renewed and repaired.

The big lens, with all the mechanism supporting it, rests in a big trongh filled with mercury, and it is so arranged that it revolves without friction.

The plant for operating the light and snpplying the electric current is in duplicate, so that a break-down of any part of the machinery will not shut off the rays of this maritime safeguard.

Galvanic Battery Efficiencies.

Some recent publications and other intimations indicate that, with the general revival of business, there are likely to be bronght before the public various schemes in which electric energy, derived from galvanic batteries, will be relied upon as the source of power. In view of this, an article on the above subject, contributed to *Cassier's Magazine* for June by Dr. Henry Morton, is of current interest. Dr. Morton presents a number of calculations pointing to the conclusion that, in the best forms of battery, an allowance of one horse power for each pound of zinc consumed per honr would be a liberal one, if something is allowed, as it must be, for the resistance, local action, etc. The entire energy of the reaction between the zinc and dilute acid in a battery is 3006 British thermal nuits. This would represent 2,320,632 foot-pounds, or 70.62 horse power for one minnte, or 1.17, say 1¼, horse power for one hour, and this would be an absolnte maximnm which conld never be reached, far less exceeded.

Of course, if we conld nse some other and more efficient reaction than that between zinc and sulphuric acid, some gaiu might be secured, but nothing of that sort has ever been accomplished, nor from what is known of the combining or thermal eqnivalents of the available elements, is much to be expected in that line. At all events, we may well accept this as a certain fact, that in any known form of galvanic battery the round figure of a ponnd of zinc per horse power per honr is an outside figure for efficiency, and when any one asserts that more than this has been secured, there is certainly some mistake or frand.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machinee to the full extent of our demands and to our entire eatiefaction. The first 700 tons of hard iron ore that we pulverized for paint purposes wae ground without taking the Pulverizer apart, and without expending one dollar for repaire for either of these machines. Of the 700 tone epoken of, about 200 tons wae Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder wae a red foesiliferous iron ore, carrying quite a per cent of silex, which cute out buhr-etonee rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track ehows LESE; in fact, the wear is almost imperceptible. Theee two machinee crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AN AGREEMENT OF SALE.—*Republican:* The agreement for the sale of the Bellwether was filed for record this week. The agreement provides that the purchase price shall be $110,000 for sixty-nine acres of mining ground; said amount to be paid by fifteen per cent of the gross output of a mill of a crushing capacity of not less than 100 tons per day. From the time of taking possession of the property and the equipment and starting of the mill the party of the second part, Joseph Underwood, is to pay to S. W. Bright, the party of the first part, the sum of $300 per month. If a mill of less than 100 tons per day crushing capacity is erected, the sum of $300 per month as well as fifteen per cent of the gross proceeds must be paid to S. W. Bright. Stoppage of work for a period of six months operates as a forfeiture of the agreement, the property thereupon to revert to the party of the first part with all improvements. Mr. Bright informs us that Mr. Underwood and his agent, Dr. Schupham, are expected here within a few days, and that he expects work will be commenced upon the mine within the next ten days. The deed has not been placed in escrow yet, but will be when Mr. Underwood arrives. Also a supplemental agreement will he made. It is claimed that a strong company has been formed in Chicago for the purpose of operating this and other claims that may he purchased. Stock has been disposed of sufficient to meet an expenditure of $6000 per month, and this amount it was anticipated would be doubled in a short time. This is the first property acquired by the company. There seems to he now a well-founded hope that this big mine will be started up in earnest shortly. Of course nothing can be said with any degree of certainty until the purchaser takes possession, but everything looks favorable that the sale will he consummated. In the development of the east or greenstone ledge of the mother lode, Jackson, and Amador county generally for that matter, has more reason to build her hopes of future prosperity than upon any other resource. The condition of the Zeila to-day sufficiently demonstrates this proposition. It is by far the largest employer of labor, and at the same time the most permanent mining property in the county. And it is the only mine operating on the east vein—a vein the croppings of which may be traced almost clean through the county.

At the Argonaut one thousand feet of new wire cable was received recently for the new hoisting works, which are to be completed and in running order by the 1st of July.

Mr. Wolfe, who has bonded the Fogus mine near Volcano, is putting up a ten-stamp mill on that property.

The Volcano Gold Gravel Company will commence cleaning up shortly. They expect the heaviest surrender of the precious metal ever made since the purchase of the mine by the present company. They have been operating in virgin ground all the season, and gravel, too, that gave all indications of being plentifully supplied with gold.

VOLCANO DISTRICT.—*Ledger:* Wolf and Campbell, who are opening up the Fogus mine, have placed an order with Knight & Co. for a ten-stamp mill, to be completed and erected by July 1st. They have opened up a twelve-foot ledge, which prospects well.

JACKSON DISTRICT.—Since assuming charge of the Amador Gold for the Jackson Gold Fields, James E. Dye has received letters which contain assurances that his company will commence work on the Amador Queen property as soon as possible. Mr. Dye is now putting two additional discharges to the one-stamp sample mill hy which he expects to double its crushing capacity, after which he will work several tons of ore from the Amador Queen as a test.

Butte.

GENERAL NOTES.—*Times:* The shaft on the Mascot mine, to he sunk 200 feet, has attained a depth of 150 feet.

The incline on the Standard mine at Oregon City is now down about 250 feet. They are running a Bryan mill to crush the ore.

Brown brothers and A. Autran will shortly open a placer claim near the Merrimac.

The new ninety-foot air shaft at the Spring Valley quartz mine, near Oregon City, has just heen completed, and three shifts of men will he put to work in the tunnel this week.

Alm and Mooney have started work on a river elaim near Enterprise. It will take about three weeks to get tbe mine in shape to work.

The Holt Flat Mining Co. are running a tunnel to tap the old river channel on their property near Enterprise.

THE SPRING VALLEY QUARTZ MINE.—At the old Spring Valley quartz mine, near Cherokee, owned by the Neshit estate and under hond to M. J. Reed, of this city, an old tunnel has heen cleaned out and is being pushed forward to crosscut the ledge. It is now in a distance of 500 feet, and an air shaft has been put down to tap it. If the ledge is what is expected the mill will he operated.

BONDED THE MINE.—The McKinley ledge, situated near Hurleton, has been bonded hy C. C. Belding and R. De Lancie. Extensive development work will he begun.

THE MASCOT AND STANDARD.—It is reported from Oregon City that the Mascot mine has struck an eight-foot ledge at a depth of about 300 feet, and that a four-foot ledge has heen struck in the Standard mine at a depth of 200 feet. Both properties have mills ready for operation.

Calaveras.

A MINE SOLD.—*Citizen:* The Nolander mine, situated near Middle Bar, has heen sold for $7000 to Jas. W. Provard. Tbe sale was completed Thursday. A large portion of the purchase price was paid at the time of the sale. The prospect is said to be an excellent one, and Mr. Provard is greatly pleased with his purchase. He left for the city Friday, intending to make arrangements for the necessary machinery, etc., to operate the mine to be shipped there. He intends to put a crew of men at work developing the mine as soon as possible.

FOURTH CROSSING.—*Herald:* The contract for sinking 100 feet in the shaft of the Thorpe mine at Fourth Crossing has been let to Messrs. Demartino & Solari of Angels. The mine is now down 200 feet and the prospects are very favorable.

DRIFT SLATE.—In piping the loosened gravel caused by the recent blast at the Central Hill gravel mine, near Murphys, a formation of drift slate was opened up which differs in its extent from any like deposit yet encountered in the mine. Underlying this is a deposit of dark red clay, which the miners call reddog. In working farther east on the Douglas Flat side of the Ceutral Hill, wherever the reddog was found it was sure to follow tbat a rich deposit of gold would be found lying on it and underneath it.

El Dorado.

THE BLUE GOUGE.—Special Corr.: At the Blue Gouge mine, twenty miles east of Placerville, development work is being pushed forward. Ore goes $8 per ton in free gold, 4% of sulphates assaying $315 per ton. A forty-stamp mill and chlorination works will be erected this summer.

THE GOLD NOTE MINE.—R. S. Raw has taken charge of the Gold Note mine, in Brownsville mining district, and has let a contract to sink the preseut shaft 100 feet deeper.

Messrs. Finch, Stevens and McKinuey have sold their placer mining claim, containing eighty acres, to parties connected with the Grand Victory mine.

Kern.

AMALIE DISTRICT.—(Special Correspondence.) Development work is being pushed as rapidly as possible on many of our claims. The Occidental which was originally located by A. Sauser and sold in November, 1894, to Messrs. Young, Foster & Co. has had some seven hundred feet of work done on it since the purchase.

There is now about three hundred and fifty tons of good milliug ore on the dump which was taken from three different leads and four different shafts, the deepest of which is down seventy-five feet, showing good milling ore all the way. From tbese shafts there have been drifts run to determine the widths of tbe ore shoots. While drifting from shaft number three on a three foot ledge of good milling ore a contact was struck, being the junction of the Amalie and Occidental lodes. At tbis junction a raise was put up to the surface aud sinking begun. The ore has gradually grown richer as they went down and at preseut there is a two foot vein of fine milling with some shipping ore.

At shaft number four, which was commenced about six weeks ago where tbe Amalie lode enters the Occidental property, they are also taking out some fiue shipping ore; the ore is a chloride silver carrying about one-third of its value in gold and is of the same character as that taken from the Amalie mine at a comparative deptb. On tbe first of last January the Occidental Co. started a tunnel which is now in four hundred feet, and when completed will cut three leads at the deptb of one hundred and seventy-five, two hundred and ten, three hundred and twenty feet respectively. The last of these, which will be cut at the depth of three hundred and twenty feet, is the Amalie lode from which so much rich ore has heen taken and which is uow developed to the depth of 200 feet on the Amalie property. The completion of the tunnel is looked forward to with great interest hy all who are familiar with the property. The best mining experts have predicted that it will open up some remarkahly valuable bodies of ore. This property joins the Amalie, aud its development so far shows chloride, ruby, sulphide and uative wire, about one-third the value of each being in gold; while from the Occidental there has been taken equally as rich chloride and horn silver as was ever taken from the Amalie at the depth to which the Occidental is at present developed. This property when thoroughly opened up will no doubt he equally as productive as anything in the camp.

The Amalie Co. has just put in a gasoline hoist which is doing fine work, using three pints of gasoline and raising five tons of ore per hour.

Mr. W. E. Rogers of the Amalie Mining Co. has gone to Sau Francisco to purchase some supplies for the company. He will return in ahout a week. G. E. F.

Mariposa.

REMARKS OF MR. COUCH.—Hon. Thomas Couch passed through Salt Lake City last Sunday on the way from Coulterville, Mariposa county, to Montana. When asked to tell what the company bad in California, he answered the *Tribune* that the property consisted of ahout twenty full claims on the mother lode, which there divides into two parallel veins; that their ground covered ahout two miles and a quarter on each vein, and included the town of Coulterville. He believes that the company has a mountain of ore which will work from $7 to $15 in the mill. About 60 per cent is free gold; the rest is in sulphurets. The company's property also includes the old Oak Flat ditch, which is taken from the Tuolumne river some thirty miles from Coulterville. The company is now putting up a mill, which will at once embrace forty stamps, with everything prepared to add sixty stamps more as soon as the entire power can he obtained. At one spot a few miles away so much fall can he obtained that 1000-horse (electric) power can be secured. At that point the company is arranging to erect their electric plant, and the power will be transmitted on wires to tbe works at Coulterville. The mines are inexhaustible; and as soon as full arrangements can be completed, the gold product of California will begin to be increased by from $3000 to $4000 daily. Tbat mother lode of California is becoming a wonder to the world. South Africa, by comparison, is not in it.

Nevada.

THE CHAPMAN MINE SOLD.—Messrs. Keating and Levy have bought the Chapman property for $35,000. It adjoins the Cbampion.

WILLOW VALLEY DISTRICT.

THE BELLEFONTAINE.—*Transcript:* The company developing the Bellefontaine mine are uow making an upraise for an air shaft. This upraise is to he 220 feet, and good ore is being taken out as work progresses.

The ledge was discovered by Harry Beech in 1858. He took nine tons of rock out of his first shaft, wbich, when crushed, paid in the neighborhood of $117.75 per ton in a mill at Grass Valley, and none of the sulphurets were saved. The lowest rock the mine ever produced paid over $24 per ton. On one portion of the ground tributers recently took out a crushing of ore wbich paid $44.53 per ton in free gold. Since then $30,000 bas been extracted from the claim by shafting on different parts of the ground. The principal owners of the property are W. H. Smitb and F. Snell of Nevada City.

Placer.

BONDED AND SOLD.—The Bartou aud Harlow mine, at Rocklin, is about to be sold. The purchase price is said to be $30,000.

W. A. Freeman and the Wallace estate have honded tbe Black Hawk mine, at Forest Hill, for a $40,000 sale.

Tbe McCall mine, situated at Gray Eagle Bar, on the middle fork of the American river, was sold for $40,000.

San Diego.

THE SHENANDOAH.—The Shenandoah mill at Mesa Grande is being repaired. The mine will be in working shape by August 1st.

Shasta.

SAYS IT WAS A "FAKE."—*Democrat:* The statement telegraphed from Redding some days ago by a "fly" reporter to the press to the effect tbat a miner's strike at Iron Mountain had been averted by the company raising wages was a fake. The wages were not raised and there was no strike contemplated. The wages are $1.50 per day for underground workmen and $1 per day for those on tbe surface.

Sierra.

GOLD RIDGE AND GOLD VALLEY.—The owners of the Gold Ridge mine, four miles below Milton, bave recently struck some very rich gravel. It is reported to go from 18 to 25 cents per pan.

Very rich rock has been struck in the Gold Valley mine within the last few days.

Siskiyou.

GENERAL NOTES.—*Journal:* A large open cut has been completed at the Benz Bar claim, at Honolulu, Klamath river, where the compauy at work is now taking out very rich pay. This is one of the richest claims on tbe river, and has paid in past seasons as high as $8000 in a single day from bottoming the bedrock.

The Greenhorn blue gravel mine of Austin & Co. still yields its regular weekly average of about a thousand dollars a week.

Good reports are received from Oro Fino of lively times in mining operations, tbe hydraulic mines being all in full operation with plenty of water. The Eastlick claim is expected to yield at least $30,000 for tbis season.

Newton Lamh's new quartz mill, near the Miner street crossing of Yreka creek, is almost ready to start up, only waiting for some new dies ordered from San Francisco. Several wagon-loads of quartz are in readiness for crushing, and teamsters will continue hauling from mines in this vicinity to keep the mill going. The benefit of a custom mill in Yreka will cause more prospecting and development of the numerous quartz ledges in the Humhug range on West side of Yreka, also at Hawkinsville and vicinity on the north, and at Greenhorn, Cherry Creek and Deadwood on the south.

A NEW MILL.—*Journal:* The Black Jack quartz mill, recently burned on Klamath river, near Hornbrook, is to be replaced with a mill of ten stamps capacity for crushing the blue gravel cement, which is very difficult to dissolve.

Hunter & Co.'s new ditch at Horse Creek, near Oak Bar, Klamath river, has heen completed for two miles, and will probably be finished to the four and one-tenth mile and end hy the 4th of July, to use in the rich Horse Creek diggings, showing excellent prospects wherever tested.

Lamh's new mill at Yreka creek is crushing quartz from the north fork of Greenhorn, supposed to contain from $50 to $75 per ton. The fine sand is saved and salted for running through the mill again, in securing the fine gold hard to separate from the sulphurets.

Tuolumne.

GENERAL NOTES.—*Democrat:* The Golden Gate mine is running steadily along day and night. The force of men employed is from 40 to 45 men.

The Black Oak mine at Soulshyville is coming out surprisingly well, and we now hear that the Scott Brothers have sold one-half of the property for $90,000.

The Birney, Wainwright, Hudson and Monroe people took out $1400 Wednesday.

At the lowest depth of the Rawhide, about 600 feet from the top, a large body of ore was recently developed.

The Marlow Mining and Development Company filed its articles of incorporation with the County Clerk Wednesday. The property to be operated is the Marlow Placer Claim northeast from and near Dan Berger's place —time of incorporation is 25 years; capital stock, $300,000—shares, same number—par value $1 each. Board of Directors—seven. Names and residences—John Graham, Forest Home, Amador Co., Frank J. Gross, Tuttletown; Cbarles E. Weinrich, Adolph E. Scheld, F. L. Enright, W. W. Anderson, George Stewart, Sacramento; Messrs. Graham, Gross and Stewart have 1,000 shares each; the remaining parties 500 sbares each. Capital stock, paid up is $5,000.

THE SEMINOLE CONSOLIDATED.—*Independent:* In the Seminole they are drifting at the 180-foot level, or No. 1, with excellent prospects. A newly erected steam hoist, with skips attached, for raising the ore, bas been completed. The main shaft will be sunk another 100 feet. The mill is at present crushing from the upper stopes, and running continually, day and night, on good pay rock. The plates look very well. On the Mayflower, a crosscut tunnel is being entered, wbich will tap the vein at 250 feet, vertical from surface. It has already advanced 45 feet. The country rock passed tbrough is metamorphic slate. The superintendent expects to intersect the vein in ahout 200 feet.

THE DEAD HORSE.—The ledge on tbe 1300-drift, 200 to 300 feet north from the main shaft is now carrying galena.

THE CONSUELLO.—This mine is to be resuscitated and a new 20-stamp mill built. It is estimated thousands of dollars value were washed away down the north fork of the Tuolumne, which now, if saved and treated by the present improved process, alone, will prove a good paying proposition, say nothing about the free gold in the rock tbat was only worked formerly.

THE JUMPER MINE.—Tbe mill is running day and night. Some timberiug is being done in the mine. Tbe shaft is unwatered. A level at the bottom is being opened to the south to intersect the rich shoots found in tbe upper levels. This is, so far, a dry mine. What water was in the shaft came from the surface percolations from last winter rains.

THE RAWHIDE.—At the 600-foot level, No. 2 sbaft, a crosscut east was entered that intersected a new vein of exceeding richness. Four skip loads came to grass, estimated at one-third gold.

NEVADA.

WASHOE CO.

THE WHITE HORSE MINE.—The owners of tbe White Horse mine, in White Horse district, are making arrangements to resume operations on the lead. They bave been sampling the ore and find that a selected piece assayed $364.10 in gold and ten ounces in silver to the ton, and an average sample assayed $31.39 in gold to tbe ton. There is a shaft over thirty feet deep on the lead and the samples assayed were from near the bottom of tho shaft, where the lead is over two feet wide.

NYE CO.

IN UNION DISTRICT.—The Belmont *Courier* says John Mayette has bougbt a ten-stamp mill of the Belmont Mining Company and moved it to Union district in western Nye to work ores from its mines. The ores of Union district carry considerable gold, and Mr. Mayette has 200 tons of rock on the dump ready for crushing.

OREGON.

JACKSON COUNTY.

C. O. White, superintendent of the Tolo Mining Company, reports a strike in the McDonough ledge, which is included in the Tolo placer purchase.

Another pocket of gold aud silver ore was taken from the Beekman & Huffer ledge on Jackson creek lately, which is much richer in gold than anything yet discovered in this ledge. No estimate of the value of these finds can be made on account of the rock being rich in both silver and gold.

Emil Holden, a scientific German, has discovered a silver and gold-bearing ledge on the divide between Jackson and Galls creeks, about four miles from Jacksonville, which is said to he the largest and most valuable discovery ever made in Southern Oregon. The ledge is 30 feet wide and has heen traced a distance of 6,000 feet. A large number of assays give the average value of the silver per ton at 50 ounces and $8 of gold. More prospecting is heing done in southern Oregon at the present time than ever before.

Ahout 60 miners are at work in Steamboat district, opening up placer mines, and the prospect is good for turning out considerable gold.

J. T. Layton's Farris gulch and Williamsburg hydraulic mines are heing operated with old-time vigor.

BAKER COUNTY.

Tbe Bonanza mine, on Chicken creek, is being developed. A 250-foot tunnel recently tapped a 2-foot vein of fine milling gold ore, which assays $150 to the ton.

Ellis & Cupid are operating their placers at Sumpter. They own hundreds of acres of paying ground and operate a hydraulic system with 15-inch pipe and 300-foot pressure.

MACHINERY FOR THE BONANZA.—*Democrat:* Supt. Al. Geiser, of the Bonanza mine, has 17,000 pounds of machinery at McEwen, which will he hauled hy wagon to the mine. It consists of a large engine and boiler, and hoisting works, which will he put in place at the mine at once.

WASHINGTON.

THE OKANOGAN COUNTRY.—Miller & Redpath are working on the Grand View at the hase of Mt. Chopacca on the west side of Palmer lake. They have sunk a shaft to the depth of 36 feet, and report the ledge 21 feet wide. The assays of the ore vary from $6 to $300 in gold. There are nine locations on this ledge.

Cowherd & Westren are getting the Ivanhoe mill ready for a summer run. They have ahout 150 tons of ore in the mill bins and ahout 700 tons on the dump at the mine. They are preparing a table covered with canvas to run the pulp over after leaving the

amalgamating tables to save the slime which has heretofore carried off considerable value. Their ores average about 40 ounces in silver and $6 in gold. Before the heavy decline in silver, this was considered the best silver proposition in the camp.

Cameron & Hart are continuously running their stamp mill on the Triune mine, Golden, with gratifying results.

A new Milwaukee company has a large force of miners at work on the Wyandotte and other claims that they have recently purchased of George Girty, on the Similkameen river, north of Palmer lake.

Henry Livingstone has recently put in a ditch and hydraulic on his placer claim on Eneas creek which he is now operating with good returns. Last season he worked the same claim by ground sluicing, and it paid well enough to warrant a more extensive plant. The gold is quite coarse, a piece weighing 50 cents not being uncommon, and it is worth about $17.50 per ounce.

There is more development work on mines in progress than at any time since 1892, and, as Congress did not enact a stay assessment lay this year, the number of men working will be constantly increasing till winter sets in, and considerable money will be sent here by interested outside parties for assessment work on their properties.

BRITISH COLUMBIA.

HORSEFLY AND VICINITY.—J. M. Browning, of Vancouver, agent for the Cariboo and Horsefly mines, says that in less than a month they will have their first cleanup. Already $60,000 have been expended this season, making the total spent on the two mines close to a half million dollars. The banks where the gold is said to be are very hard, and to facilitate washing them out 40,000 pounds of powder has been let off in T-shaped tunnels dug into them. The scheme was a success, the immense bank being heaved up several feet and the earth loosened from base to top. He expects that this season the $60,000 spent will be made up and a handsome dividend paid as well.

The Victoria Company has 45 men engaged on its claim on the Quesnelle river, opening up a ditch used some years ago.

Forty-five claims have been staked by private parties near the Horsefly, and are being worked by hand process. Some cleanups as high as an ounce a day are reported.

J. B. Hobson, manager of the Cariboo Hydraulic Co. at Quesnelle, says that more men are going into Cariboo than can find work. Quite a number are destitute, and it would be charity to dissuade those who have no means from going up.

GENERAL NOTES.—Kamloops *Sentinel:* The Cariboo Hydraulic Company is working two nine-inch nozzles, using 3000 inches of water with 200 feet head.

The Horsefly Hydraulic Company is working night and day with 2000 inches of water forced through seven-inch nozzles by a pressure of 150 feet.

A scheme is on at Quesnelle to dam the south fork and hold the water in Quesnelle lake, thereby laying the bed of the river bare, which is known to be very rich.

Last year the Quesnelle River Hydraulic Company built 450 feet of dam to raise the water in Dog lake, but the water has washed through beneath, so that probably no hydraulicking can be done this summer.

A fifth tunnel is to be run on the Slocan Star at a depth of 1200 feet. Twenty men are working, and 20,000 tons of concentrating ore await the concentrator, which will be put in at once. Two drills and an electric light plant will be put in this summer.

The Ottawa Hydraulic Mining and Milling Company, with a capital stock of $250,000 in $5 shares, has been incorporated to take over a lease of grounds on Boston Bar, Fraser river.

IDAHO.

TO EXPEND $15,000.—The Lemhi Gold Mining Company has received returns on a shipment of ore which yielded $61.80 in gold, silver and copper. Bids are now being received for the erection of a thirty-five-ton plant, to consist of Bryan mills and concentrators, which will be erected at once. This plant will cost about $15,000. The properties owned by the Lembi Company also produce free-milling gold ore and a very light grade smelting ore.

UTAH.

A DISAPPOINTMENT.—*Tribune:* The last work on the test of Midas ores by the pan-amalgamating method was completed yesterday when the amalgam from the vein in the Ontario mill was retorted. The result was another disappointment, as the amalgam showed only about 22½ per cent saved, and it is now a puzzle to find where the loss occurs. There were 18,220 pounds of selected ore put through the mill, the assay value of which was $6260 per ton; and as the run was made, the tailings were sampled at intervals and showed a loss of from 15 to 18 per cent, encouraging Messrs. Chambers and Mackintosh into the belief that, by the pan-amalgamating process, at least 82 per cent could be saved. Certainly, the loss cannot be found in the tailings, but where it exists is the puzzle.

The ore is very refractory and has withstood the Crawford mill, the cyanide process, the Roth amalgamator and now the pan amalgamator; but hopes are still entertained that a process will be found that will successfully treat the ores.

MONTANA.

The Odin mine, near Butte, has been sold to C. F. Booth, representing the Washoe Copper Company. The price to the original owners—P. A. Largey and E. O. Dugan—was $50,000. The leasers of the property got $50,000 also.

WYOMING.

AT CUMMINS CITY.—Cummins City, near the Colorado line, is receiving some attention. In 1880 Cummins was one of the liveliest camps in the West. Its downfall was attributed to the fact that the ores, although containing a large amount of gold, could not be profitably worked by the processes then in vogue. The miners were unable to separate the yellow metal as the ore was filled with iron which carried the gold from the plates. Three Chicago men have gone there with a furnace and other apparatus to determine the value of the mineral. They have located a number of claims, the titles to which have long since expired so far as the original mine owners are concerned.

NEW MEXICO.

THE COCHITI MINES.—The machinery for the Beckman ore reduction plant at Bland, consisting of ten stamps, engine and boiler and other needed appliances, has reached Wallace from California and will be transferred to the Cochiti district at once. The new mill building is ready for the reception of the machinery, and within the next few weeks everything will be in readiness for steaming up.

Roger W. Woodbury of Denver, president of the Cochiti Mining and Milling Company, says that, as soon as he can procure a competent man, and the proper method of treating the Cochiti ores, he will enlarge the mill at that place. The mining company, the milling company, the Allerton Townsite Company and the water company have all been consolidated under one management, of which Mr. Woodbury is president. W. C. Wynkoop of Denver has been tendered, and will probably accept, the office of manager of the combined interests.

COLORADO.

AROUND LEADVILLE.—It has been many years since the camp has been so full of life and mining activity and the prospect of a large amount of summer work has been so promising, says the Leadville *Herald-Democrat.* The gold belt has been very thoroughly discussed and exploited in print, and, in spite of the efforts of people who would prefer to see stagnation, continues to be the field of extensive and promising mining operations. There are, in the territory between Empire and Big Evans gulches, at least 35 companies at work, either engaged in putting down shafts or in shipping mineral. Among the new producers to be added to the gold belt mines are the Cleveland and Spot Cash. Both these properties have good bodies of mineral and are now in a position to hoist from eight to ten tons daily.

CRIPPLE CREEK MINES.—*Miner:* It is remarkable, but a fact, that not $5000 was spent on any one of the eighty-two pay mines of Cripple Creek before a strike of shipping ore was made, and in half the mines that are rich producers to-day the development work necessary to reveal the golden treasure cost less than $2000.

ARIZONA.

GOING TO BUILD A MILL.—Kingman *Miner.* The Gold Bug Mining Company have in contemplation the erection of a mill on the Colorado river, below the Gold Bug mines. The plant will have a capacity of over thirty tons per day. The district, in which is situated the Gold Bug, has long needed a mill and this one will be hailed with delight by the mine owners.

AT DOS CABEZAS.—*Prospector:* The bonding of the Casey mine, one of the best gold producers in the Dos Cabezas gold camp, for $90,000, and the investigating of other mines in this county by capitalists, is part of the attention gold properties of Cochise are receiving by monied men.

A New Form of an Old Cure for Stiff Joints.

The application of heat is one of the universal remedies for the various forms of rheumatism. Almost every modern city has its Turkish or Russian bath, and innumerable uncivilized tribes enjoy the same luxury in cruder shape. Travelers in the Navajo country will often find close to the trail which leads to the neighborhood of water small huts such as children might build in imitation of Indian tepees. These are the "sweat huts" of the Navajos. When one of that intelligent and thrifty tribe finds himself beset by severe cold or rheumatic pains, he goes to a secluded spot close to water, and builds a little conical hut of sticks. The bottom ends of the sticks may be possibly two feet apart and the upper ends are lashed together in a point. The interstices of this rough edifice are carefully chinked up, and the inside is covered with a layer of mud, which makes it absolutely airtight. Then, building a fire, the Indian places stones on the embers. When the stones begin to crack with the heat they are cast inside the hut and water is thrown upon them. The Indian creeps in, closes the narrow entrance aperture and remains there in the steaming atmosphere until he is nearly suffocated. The latest form of this crude therapy is used in a London hospital. It consists of a copper cylinder about three feet long and eighteen inches diameter, which will hold an arm up to the shoulder or a leg up to the middle of the thigh. The patient, who is suffering from sprains or gout or rheumatic affections, is placed in an armchair, the limb is introduced into the cylinder and the joint made airtight by a rubber band. The inside temperature of the cylinder is raised if necessary, to 300 or 400 degrees Fahr., by means of gas burners. When the enclosed moisture begins to have a scalding effect, which occurs at about 250 degrees, the end of cylinder is opened and the moisture escapes. The effects are greatly increased local circulation, profuse perspiration and relief from pain.

Water Power and Electric Transmission.

A power station with electric transmission has recently been made in Fitchburg, Mass., which has some features of special interest and is attracting much attention. The water supply is obtained from the Wanoosnoc river, which has a minimum flow of 2000 cubic feet per minute. This is brought to the power house in a 36-inch pipe line 1800 feet long, terminating in a receiver 48 inches in diameter, to which the wheels are connected by lateral branches.

The power station is located about three miles from the city of Fitchburg, and consists of six Pelton wheels, 28 inches diameter, having an aggregate capacity of 600-H. P., all running on one shaft enclosed in three separate compartments, as shown in cut. The wheels run under a head of 130 feet at 135 revolutions per minute and are direct connected to a 300-K. W. Westinghouse two-phase generator. The current is generated at a potential of 2250 volts and handled at this pressure on a switchboard which is transferred directly to the transmission circuit. The exciter is run by a separate Pelton wheel at 1150 revolutions, carrying 110 volts. The power thus generated is transmitted to the Simonds saw factory two and one-quarter miles distant, where the potential is reduced to 220 volts by means of two 100-K. W. Westinghouse transformers, the current operating eleven motors of various capacities, these being of the Tesla self-starting type.

The speed of the wheels is controlled by a Pelton differential governor and the regulation afforded is entirely satisfactory under what is regarded as the most difficult conditions anywhere to be found, owing to the constant and wide variations of load.

The entire power is used by the Simonds Saw Works, one of the largest factories of the kind in the country, and the working power station has been so satisfactory that a material enlargement has already been decided upon. Pelton wheels, in such favor and so exclusively used throughout the West, are now coming largely into use in the East, as well as in most all foreign countries.

The New York works of the Pelton Company enable them to fill orders from Eastern States, as well as many foreign countries, where freight rates would be prohibitive from this side.

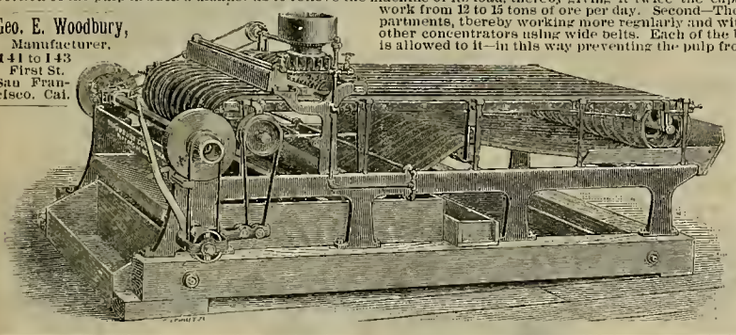
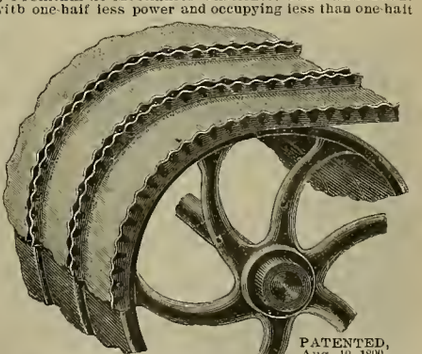
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

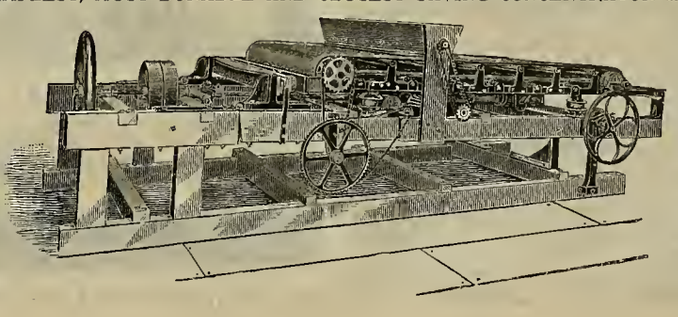
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works

Market Reports.

The Markets.

SAN FRANCISCO, June 6, 1895.

Silver has certainly become a national question and supersedes the tariff as a topic of party discussion. The day has passed when the argument can be used that silver is a "commodity" the market price of which is of more interest to the silver miner than any one else. The one State of Illinois has lost more by the slump of silver during the last lustrum than all the miners in the Pacific States and Territories. They are just finding it out.

There is a firmer tone throughout the entire metal market.

New York Metal Market.

NEW YORK, June 6.—PIG IRON—Scotch, 19@20c; American, 9.50@10.50c.

COPPER — Brokers', 10.50c: exchange, 10.60c.

LEAD—Brokers', $3.07½; exchange, $3.27½.

TIN—Straits, 14.20@14.25c.

SPELTER—Domestic, $3.60.

Mining Share Market.

SAN FRANCISCO, June 6, 1895.

The little see-saw on the street left prices and values in about the same condition. The decline in Bodie, and the non-appearance of the Hale & Norcross decision, were secondary to the interest manifested in the latest and best movement—the consolidation of Comstock interests in thoroughly prospecting the Brunswick lode. F. Leonard, the newly elected president of the Comstock Tunnel Co., and two of the directors will be in Virginia City next week, and, it is expected, will visit this city to confer with the directors of the various companies concerned in the new movement. The most sanguine claim that the proposed working of the Brunswick ground will create a revival of old bonanza days in that vicinity.

A statement of the cash balances of the following mining companies on the first Monday of June is appended:

BODIE MINES.		Exchequer	$ 2,037
Bodie	$12,618	Gould & Curry	6,502
Bulwer	2,197	Hale & Norcross	5,245
Mono	2,501	Julia	.....
Standard	35,884	Justice	224
WASHOE MINES.		Kentuck	2,304
Alpha	$ 2,483	Lady Wash'n	1,560
Alta	317	Mexican	2,123
Andes	11,214	Opbir	12,581
Belcher	8,887	Overman	10,767
Best & Belcher	3,446	Occidental	1,290
Bullion	4,850	Potosi	11,171
Caledonia	2,836	Savage	11,017
Challenge	828	Scorpion	480
Chollar	7,430	Seg Belcher	4,324
Con. Cal & Va	52,800	Silver Hill	2,078
Confidence	5,558	Sierra Nevada	11,189
Con. Imperial	427	Union Con	6,112
Con. New York	1,478	Utah	742
Crown Point	15,704	Church	5,622
East Sierra Nev	88	Gray Eagle	1,164

The Con. Cal. & Va. has $18,395 in unsold hullion on band.

The followiog mining companies reported having an indebtedness on the first Monday of June:

Belle Isle	$ 3,012	North Com'wealth	$ 4,440
North Belle Isle	868	Silver King	3,108
Navajo	1,110	Summit	635

The Standard Consolidated Mining Company of Bodie has declared a dividend of 10c per share, payable on the 20th.

During May at the Alaska-Treadwell mine the mill ran 29½ days and crushed 22,226 tons, averaging $8 20 per ton: there were 342 tons sulphurets treated, yielding $25,240: the total bullion output was $71,319. The expenses for the month were $23,413.

The following illustrates the changes of the week:

MINES.	29	6

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 28, 1895.

539,971.—CAN OPENER—W. N. Anderson, S. F.

539,787.—GATE—J. F. Bean, Martiuez, Cal.

540,149.—SASH FASTENER—D. A. Crichton, Los Angeles, Cal.

540,150.—SASH FASTENER—D. A. Crichton, Los Angeles, Cal.

539,804.—GOLN SEPARATOR — Gibbens & Murray, Portland, Or.

539,806.—PHONOGRAPH—L. Glass, S. F.

540,099.—CAN OPENER—T. B. Hagerty, S. F.

540,057 —CAR COUPLING—T. F. Hudson, Pasadena, Cal.

540,060.—ELECTRIC RAILWAY—W. E. M. Jackson, S. F.

540,061.—BAND CUTTER—W. S. Judd, San Diego, Cal.

539,991.—LEAF TURNER—H. Kramer, S. F.

540,212.—SMOKE CONSUMER—T. P. Magrath, S. F.

539,997.—HAY DERRICK—D. Ogilvie, Lee, Nev.

540,195.—COIN CONTROLLED APPARATUS—G. F. W. Schultze, Berkeley, Cal.

540,202.—PIPE—H. F. Williams, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN LABELING MACHINE.—Emmett E. Magee, San Jose, Cal. No. 539,280. Dated May 14, 1895. This invention relates to a machine for placing labels upon cans. It consists of mechanism by which the labels are cut singly from a continuous sheet and delivered upon a table, an inclined track situated beneath the cutter and the table over which track the cans roll by gravitation, stops actuated in unison with the cutter so that a single can is allowed to pass when each label is severed from the sheet, a paste receptacle and roller in the pathway of the can by which a strip of paste is applied to one side of the can, so as to engage the projecting end of the label, an endless traveling belt between which and the can the label is received so as to press it upon the can and draw it off the table while the can continues its rotation; a second paste receptacle and roller by which another strip of paste is applied so as to receive the opposite end of the label which is pressed down upon the can by an endless traveling belt previously mentioned.

GAS ENGINE.—H. J. Dykes, Peralta, Cal., assignor of one-half to Julius A. Frost, of Oakland, Cal. No. 539,122. Dated May 14, 1895. This invention relates to improvements in gas or explosive engines. It cousists of a cylinder with a piston and crank shaft, au explosion chamber exterior to the cylinder having a tubular connection through the cylinder head, and an exhaust valve for the cylinder, an electric contact device within the explosion chamber connected with a hattery wire and a longitudinally moving ignition plate, or arm, extending through the tubular connection, so that one end enters the explosion chamber in line with the fixed electric contact point, and the other end projects into the cylinder, so that when the piston arrives at that end, and the gas is properly compressed, it forces the movable contact rod into the explosion chamber, making a contact with the other electrode and producing the electric spark for the explosion. The movable electrode is connected with contact devices on the exterior of the cylinder, and suitable mechanism is provided for actuating the movable contact and opening and closing the exhaust valve.

BALING PRESS.—Jose Jacintho Mathias, Mountain View, Cal. No. 539,588. May 21, 1895. This haling press has two vertically disposed haling chambers, each having a follower within it, said followers operating alternately so that the haling and discharge operations are continuous. The followers are operated alternately by means of crossed levers connected with their bottoms and which travel over underlying continuous tracks common to both pairs of levers and an oscillating power drum from which a single chain extends, and is properly guided to both followers whereby it operates them. There is a slide door affording access to the feeding chamber of the press, a spring connected with the lower portion of the door which tends to hold the door normally open, and an automatic tripping device operated by the follower, whereby the door is released from a locked vertical position and allowed to open under the influence of its spring.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from John B. Rathburn et al in the Lost Camp mine, near Blue Canyon, Placer county, to impound tailings behind brush dam in Wood's Ravine; and from A. J. Mason, in the McFadden mine, near Mokelumne Hill, Calaveras Co., to impound tailings behind rock and brush dam in Buckeye gulch, gives notice that a meeting will be held at Room 22, Flood building, San Francisco, Cal., June 17th, 1895, at 1:30 P. M.

MICHIGAN MINING SCHOOL, Houghton, Mich. A high grade technical school. Practical work. Elective System. Summer courses. Gives degrees of S. B., E. M. and Ph.D. Laboratories, Shops, Mill, etc., well equipped. For catalogues write to the Secy. M. E. WADSWORTH, Ph.D., Director.

CAPITAL WANTED

To develop Gold Lode Claims. No reasonable rellable offer refused. Call on (or write) A. W. CALLEN, Walnut Grove, Arizona, to see the property, or address owner, P. N. TAYLOR, 82 Superior St., Cleveland, Ohio.

Assessment Notices.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of May, 1895, an assessment (No. 49) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of June, 1895, will be delinquent, and advertised for sale at puolic auction, and unless payment is made before, will be sold on TUESDAY, the 2d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY—Location of principal place of business, San Francisco, California Location of works, La Porte, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of May, 1895, an assessment, No. 1, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of June, 1895, will be delinquent and advertised for sale at public auctiou; and unless payment is made before, will be sold on MONDAY, the 22d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, California.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of June, 1895, an assessment, No. 2, of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the corporation, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 27th day of July, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

STOCKHOLDERS' MEETING.

SPECIAL MEETING OF THE STOCKHOLDERS of the Gould and Curry Silver Mining Company.—Notice is hereby given that, pursuant to resolution of the Board of Directors, a special meeting of the stockholders of the Gould and Curry Silver Mining Company will be held at the office of the Company, Room 69 in the Nevada Block, No. 309 Montgomery Street, San Francisco, WEDNESDAY, the 12th day of June, 1895, at 12 o'clock M. The object of said meeting is to decide, vote upon and ratify a proposition to purchase additional mining ground.

Dated San Francisco, May 24th, 1895.

A. K. DURBROW, Secretary.

GLADSTONE MINING COMPANY, C. J. Clark, M. E., Gen'l, Supt. FRENCH GULCH, Shasta Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

California Marble.

Previous issues of this paper bave given prominence to many of California's structural materials, showing a wealth of mineral deposit second only to the metallic treasure within our borders.

This week is presented two views of California marble quarries, one in Inyo, tbe otber in Tulare county. As in the case of other valuable building material, marble is found in nearly every part of the State. Valuable deposits of this beautiful form of limestone have been found in Amador, Butte, Calaveras, El Dorado, Humboldt, Inyo, Kern, Madera, Nevada, Riverside, San Bernardino, San Diego, Santa Clara, Shasta, Tuolumne aud Tulare counties. In Amador tbere are three fine quarries, one a blue-veined marble near Jackson, another of red marble near Ione, and a white marble in the vicinity of Plymouth. On the Feather river in Butte county is a fine deposit, unworked. In Calaveras county, as in other sections of the State, lack of transportation facilities prevents the quarry below Vallecito from heing worked. El Dorado county is ricb in marble. Near Placerville Bind & Co. operate marble works. Humboldt possesses marble, but too remote to be of preseut commercial value. White, black and variegated marble is quarried near Keeler, Inyo Co. Some of the Inyo marble is in use in this city, and attracts deserved attention. The Madera marbles, near Hite's Cave, are undeveloped. Iu Nevada Co. tbe South Yuba Marble Co., near North Bloomfield, furuishes merchantable marble. Near Colton is some of tbe handsomest marble in the State, and there is an undeveloped deposit of snow-white marble near Whitewater. Victor, San Bernardino Co., shows a fine-grained quality, and at San Jacinto, San Diego Co., is a deposit of pure wbite marble, but almost inaccessible. Ahout five miles from the New Almaden quicksilver mine, Santa Clara Co., lies fine-handed marble in a most favorable location for shipment. The Red Bluff Marble Co., of Shasta, supply a large local trade. Near Sonora and at Columbia, Tuolumne Co., an excellent quality of marble is being quarried. The Rocky Point, Tulare Co., marble quarry also furnishes abundance of this beautiful crystallized limestone, which, from the earliest days of Greece to these sunset days of the 19tb century, has been so highly valued for statuary and ornamental building. The value of the marble industry of California for '94 is estimated at $200,000.

INYO MARBLE QUARRIES (WHITE).

ROCKY POINT MARBLE QUARRY, TULARE COUNTY.

In the Interests of the Miners.

The legislative committee of tbe State Miners' Association has drafted a bill which will be presented at the next session of Congress. The changes from tbe present law are easily recognizable. While tbe interests of the Government are carefully guarded and the public requirements fully observed, the proposed revision makes it wholly possible (as against almost wholly impossible as at preseut) for a miner to show that a tract in question is mineral land. It transfers the trial aud determination of tbe question from an ignorant to a competent tribunal, and places the contest in tbe court in the county in which the land in dispute is situated. The full text of the proposed revision is as follows:

A Bill to amend Chapter Six, of Title Thirty-two, of the Revised Statutes, relating to Mineral Lands and Mining Resources.

Be it enacted by the Senate and House of Representatives of the United States, in Congress assembled: SECTION 1. That section twenty-three hundred and twenty-four of the Revised Statutes he amended so that the same shall read as follows:

"SEC. 2324. Miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which it is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced, such marking to include one post or monument at each corner of the claim. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location and such description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located, and until payment of the purchase money and a certificate

TABLE OF CONTENTS.

ILLUSTRATIONS.—Inyo Marble Quarries (White); Rocky Point Marble Quarry, Tulare County, 373. Various Designs of Battery Frames in Pacific Coast Quartz Mills, 376. Fixed Spindle Boring and Mortising Machine, 377.

EDITORIALS.—California Marble; In the Interests of the Miners, 373-374. The Commissioner of the General Land Office; The Co-operative Plan; Readers of Weekly Papers, 374.

CORRESPONDENCE.—A Question and Answer; California Clays—Stove Lining; Some Practical Experience; Aluminite in Yuba Co., 377.

SCIENTIFIC PROGRESS.—Telegraphing Without Wires; Protection of Iron and Steel; Carbon Monosulphide; Temperatures of Filaments in Electric Incandescent Lamps; The Value of Tests, 379.

MECHANICAL PROGRESS.—Power Absorbed by Rope and Belt Transmission; A "Cranky" Belt; An Automatic Typesetter; Back Number Advice, 379.

ELECTRICAL PROGRESS.—Highest Efficiency of Galvanic Batteries; Waste in Electric Stations, 380.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 382-83.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 386.

MISCELLANEOUS.—Concentrates, 375. Battery Frames; Some Recent Additions to the Museum of the State Mining Bureau, 376. Between November and May; Fixed Spindle Boring and Mortising Machine, 377. Cyanide Practice; Wages in the Lake Superior Copper Mines; Coast Industrial Notes, 378. Railway Construction in the Peruvian Andes, 384. Notices of Recent Patents, 387.

THE receut statement iu this column that S. W. Lamoreux, the commissioner of the general land office, appears to he a willing tool of the S. P. Co., in the present contest hetween that corporation and the Cal. Miuers' Association, receives fresh confirmation this week in that official's reversal of his own rules in deciding plainly against all equity and in favor of the corporation. His official acts appear to he hased on the proposition that, if the S. P. Co. wants agricultural land to be declared mineral land, it shall he so ordered. If the facts are in direct opposition to such declaration, so much the worse for the facts. This U. S. official has dismissed a protest made hy E. H. Benjamin, on hehalf of the California Miners' Association in defiance of the law, in disregard of his own rulings and directions, and in opposition to the plainest provisions of his own instructions of July 9, '94. In short, he has done this just hecause he could, hecause his official position gives him the opportunity. We are more sorry than surprised to chronicle this action on the part of so prominent a federal official. Such persistent prostitution of so high a post gives great color to the helief so generally asserted that undue influence is brought to hear upon Commissioner Lamoreux, aud that his acts are plainly dictated by those who appear to consider they have the same right of control that huyers usually have of any purchased commodity. We do uot charge Commissioner Lamoreux with heing hought. But he acts with singular similarity to men in and out of federal position who have heen influenced that way. Meanwhile, California miners can understand how extensive are the operations of the power they are at present opposing and the need of supplying the Association that is fighting their hattles with money to keep that fight up. An appeal will he filed by the committee ou the protection to mineral lands and the validity of Mr. Lamoreux's action contested. When Messrs. Ricketts and Ralston were recently in Washington they quickly realized that it was useless to waste time with the commissioner of the general land office. He and his suhordinates appeared to he impervious to argument or statemeut of any other side than that of the corporation. The President of the United States was interviewed, he promising to give the matter his personal attention. It is prohahle that neither he nor the Secretary of the Interior know auything of this recent prank of Mr. Lamoreux's. That gentleman places himself in a very suspicious position. No pettifogging shyster in a country justice court ever attempted a more contemptihle evasiou of honorahle practice than the commissioner of the general land office in the case under discussion, wherein, under the flimsiest form of subterfuge, he tries to throw out a protest made hy the Cal. Miners' Association against the absorptiou in the Los Angeles district of an area of mineral land hy the S. P. Co., construing every possihle meaning of words against the association and in favor of the corporation. The present appears to he a very good time for Mr. Cleveland to make good his pledge to Mr. Ricketts that these matters would receive his personal attention.

In the Interests of the Miners.

(Continued from preceding page.)

of eutry has heen issued therefor, not less than $100 worth of labor shall he performed or improvements made during each year.

"Where such claims are held in common such expenditure may he made upon auy one claim by any work or improvements tending to develop any of such claims. The period within which the work required to he done annually on mineral claims is to he performed shall commence at 12 o'clock meridian on the first day of January succeeding the day of location of such claim. When the lahor required by this act shall have heen performed or the improvements made an affidavit may he filed within thirty days after the time limited for the performance of such lahor or making of such improvements with the Recorder of Deeds in the county in which the claim or mine is situated, particularly describing the lahor performed and the improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated; aud upon a failure to comply with the conditions of this act, in the performance of lahor or the making of improvements, the claim or mine upon which such failure occurred shall he open to relocation in the same manner as if no location had ever heeu made; provided that the origiual locators, their heirs, assigns or legal representatives do not resume work upon the claim after such failure and hefore such relocation, and continue the same with reasonahle diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contrihute his proportion of the expenditure required herehy, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice hy puhlication in the newspaper published nearest the claim for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or hy publication, such delinquent shall fail or refuse to contrihute his proportion of the expenditure required hy this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure. The copy of such uotice, together with an affidavit showiug personal service or publication, as the case may he, of such notice, when filed and recorded with the Recorder of Deeds in the county in which such mining claim is situated, shall he prima facie evidence of the acquisition of title of such co-owners. Where a person or company has run or may run a tunnel, or coustructed roads or trails, for the purpose of developing a claim or claims owned hy said person or company, the money so expended in running said tunnel or constructing said roads or trails shall he taken and considered as expended on said claim or claims; provided, further, that said claim or claims shall he distinctly marked ou the surface, as provided in this act."

SEC. 2. That section twenty-three hundred and twenty-four of the Revised Statutes he amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 3. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read as follows:

"SEC. 2335. All affidavits required to he made under this chapter may he verified hefore any officer authorized to administer oaths in the State or Territory where the claims may he situated, having an official seal, and all the testimony and proofs may be taken hefore any such officer, and when duly certified by the officer taking the same, attested hy his seal of office, shall have the same force and effect as if taken hefore the Register and Receiver of the Land Office. Whenever any contest shall arise as to the mineral character of any land claimed to be suhject to entry or sale under an act of Congress, it shall he the duty of the Register of the Land Office in which such contest is made to immediately certify such contest to a court of competent jurisdiction in the county where such land is situated, and to immediately notify the contestant and contestee thereof. Within thirty days after such notice the contestant shall file in such office a verified statement of the facts upon which he hases his contest in plain and concise language, and shall serve the same upon the the contestee, and thereafter and within the time provided by the laws of the State or Territory where such land is situated, for answering in any civil action, the contestee shall file his verified auswer to such statement, and thereupon the contest shall he tried and determined as are ordinary actions in such court, and when determined such determination shall he certified to the Register, and such determination shall he hinding upon him and shall he forever conclusive as to the character of the land in question; provided that the presence of rock in place hearing gold, silver, cinnahar, petroleum or other valuahle mineral shall be regarded as presumptive evidence that the land containing the same is mineral in character; and provided, further, that in investigating the character of the land with a view to ascertaining whether it is more valuahle for mineral than for agricultural purposes, evidence may he taken of the mineral discovered or developed adjacent to such land, proof of which shall be taken as presumptive evidence that the land in question is mineral in character; aud provided, further, that wherever land is proven to he within a well-defined mineral helt, such land shall be deemed, presumed and taken to he mineral land, unless the contrary is proven; and provided, further, that the provisions of this chapter shall be liherally construed, with a view to aid the applicant in procuring title to the mineral lands of the United States, and that the rules and regulatious prescribed by the Land Department for its government and that of its officers, in disposing of said lands, shall be so formulated and administered as to assist the Government in disposing of said land to bona fide applicants; and provided, further, that all applicants for patent for lands, other than mineral lands, upon which exists a valid mining location, the uotice of location of which, designating the section and township in which such location is situated, shall have been recorded in the office of the Recorder of Deeds of the county wherein the land in question is situated, must, except when otherwise in this act provided, give to such mineral claimant notice of such application in writing, or hy publication in the newspaper published nearest such mining location at least once a week for sixty days."

SEC. 4. That section twenty-three hundred and thirty-seven of the Revised Statutes he amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to be used or occupied, hy the proprietor of such vein or lode claim for mining or mineral purposes, such non-mineral surface ground may he emhraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately suhject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims, hut no location hereafter made of such non-mineral land shall exceed ten acres, aud payment for the same must he made at the same rate as fixed hy this chapter for the superfices of the lode claim. The owner of a quartz mill or reduction works not owning a mine in connection therewith may also receive a patent for his mill site as provided in this chapter."

MENTION was made some months ago of the Morning mine in the Cœur d'Alene district which was worked on the co-operative plan, the experiment heing a novel one. The Chloride mine, on Rock creek, sixteen miles from Baker City, Or., is to he worked on the same plan hy J. K. Romig, tbe lessee. There is an ahundance of low-grade ore, and the plan is that, after paying the expenses of transportation and smelter charges, the net proceeds are to he divided pro rata among the mine owners, the lessee and the miners.

AN advertising medium says that the ordinary weekly has an average of ten readers to each copy printed. If this he so, it would he fair to assume that a representative journal like this paper has fifteen readers to each copy printed. On this hasis, which is helieved to he a fair oue, nearly 100,000 men read this paper every week.

Concentrates.

C. D. LANE proposes to put in a 20-stamp mill at the Mayflower, near Nevada City.

THE *Arizona Journal* reports the mountains from Fort Bowie to Turkey Creek full of prospectors.

COL. FRANK MCLAUGHLIN expects to turn the river into the canal at the Golden Feather before July 1st.

OVER $10,000 was paid out by the Kingman, Arizona, Sampling Works last week, the best showing made in two years.

A QUARTZ MILL is to be erected at the Montgomery mine, in Sailor canyon, fourteen miles south of Cisco. J. B. Campion is superintendent.

WASHINGTON, D. C., MEN have bought a half interest in the Humphreys gold property, six miles from Globe, Arizona. A 10-stamp mill will be built.

AT Coulterville, Mariposa Co., the Merced Gold Mining Co. have 150 men at work. A three-compartment shaft is being sunk on the old Coon property.

PROMPT destruction of some adjacent buildings by giant powder placed therein prevented the burning of the entire town of Downieville, Sierra Co., last Saturday.

ALTHOUGH mining has ceased at the Harqua Hala, Arizona, men are prospecting for the lost ledge. It has been found before, and miners believe it can be found again.

T. A. ENISON is said to have originated a concentrator for refractory gold ores that will save all the gold in them and to have bought a mine in North Carolina to experiment with.

THE "company store" causes threats of a shutdown on the part of the Broadwater Company, and a boycott on the part of the miners at Neihart, Montana. The monthly pay roll is $12,000.

BARON CHOISY and E. DeBourgade, who have been examining several gold properties, have returned to Paris with options on four mines with an aggregate valuation of nearly $3,000,000.

THE 10-stamp mill that was destroyed by fire May 27th at the Gold Ring mine, Grass Valley, on the north fork of the American river, three miles from Dutch Flat, will be rebuilt immediately.

CARSON, Nevada, papers say that Jas. Yerrington, who recently bonded the principal Silver Peak, Esmeralda Co., mines, has sold them to Senator Wolcott and associates, of Colorado, for $600,000.

THE report that the Kennedy, Amador Co., mine has been sold to French capitalists for $2,000,000 is denied by one of the owners. There is an option on the property but the deal is still under consideration.

A TUNNEL is being extended several thousand feet at the Green Mountain and Cherokee mines, Indian valley, Plumas Co., to strike the vein lower down. A large number of men is employed there at present.

THE 3500 employes of the Calumet and Hecla Mining Company will have their wages restored ten per cent, the amount of the reduction in 1893. Many laborers there receive but a little more than a dollar a day.

H. MCPHEAL has sold the Golden Eagle, Golden Mound and Ocean Wave, free-milling gold claims in the Harqua Hala district, thirteen miles from Harrisburg, Arizona, to G. F. McFall of Phœnix, Arizona, for $46,000.

W. H. BRADLEY has put a twelve-horse power double cylinder gasoline engine in the Chapparel mine at Julian for working a hoist and furnishing power for electric lights. The engine is located at the bottom of an 800-foot shaft.

A BAR of gold was cast at the Helena, Montana, assay office last week, being 11½ inches long, 5½ inches wide and 3½ inches deep. It weighs about 1437 ounces and its value will run from $21,500 to $28,000, according to fineness.

A. T. THOMPSON, of Phœnix, Arizona, who recently bonded some mines in the Humbug district, is instructed by the eastern company which he represents to put men at work on the development of the property and begin preparations for the erection of a mill.

ABOUT April 25 a rate of $6 per ton was made by the railway people for hauling ore from Wood river to Salt Lake. A circular just issued by the railway managers gives notice that this rate has been withdrawn, and the old rate of $8.65 restored, which is bad all round.

EFFORT is being made to secure resumption of work in the Cœur d'Alene country. The proposition is to reduce the miners' wages fifty cents a day from the old rate; the companies' mining boarding houses agreeing to reduce board and lodging from $7 per week to $5.

THE *South African Financial Record* thinks the wages of native labor in the Randt mines should be reduced and calculates that a reduction of five cents per day in the wages of the negroes working in the mines would aggregate a reduction of $500,000 per annum in the amount paid for labor by the companies.

THE two Nevada districts most prominent now are Silver Star, near Soda Springs, and Silver Peak, in the southern end of Esmeralda county. The mines in both districts are exclusively gold-producing, notwithstanding their names. The Hawthorne *Bulletin* thinks they should be called Golden Peak and Golden Star.

PROSPECTORS have developed placer mines on the Boise river, Idaho, above the mouth of Moore creek, by drifting. To construct a ditch necessary to accommodate the miners will require an expenditure of $18,000 or $20,000, and those owning the bars will make an effort to get some capitalists to built it for them.

THE absence of bar deposits from the Omaha-Grant refinery at Omaha is evident in the report of the local branch mint for the month of May says the *News*. The total receipts footed up $351,567.97 compared with $431,933.62 for the corresponding month last year. The loss equals $80,365.65 or eighteen per cent.

AT the Yellow Jacket, Idaho, mine it is reported that the total cost of mining and milling, including office expenses, etc., is $2.67 per ton. Seventy stamps are to be added to the mill and a pipe line and flume built to carry power to an electric plant. Messrs. Roeder and Searles figure that, under the new conditions, the monthly yield will approximate $50,000.

LONDON capitalists have completed an arrangement to buy the Alaska and Grizzly mine at Pike City, Sierra Co., and will develop the mines, putting on additional machinery, and probably doubling the present working force of sixty men. W. W. Casserly, the superintendent, thinks the new company will expend $150,000 on the property in new machinery and development work.

THE Secretary of the Interior has approved the recommendation of Director Walcott, of the Geological Survey, regarding work in this State. H. W. Turner will finish mapping the Bidwell Bar, Butte Co., sheet and the Sonora, Tuolumne Co., sheet. W. Lindgren will write up his report on the field work in the gold belt of California. A. C. Lawson will continue the survey of the Coast Range in the vicinity of this city.

THE Siskiyou Mining Company, incorporated in Baltimore, Maryland, has located about 500 acres of copper mining ground along the Illinois river on the west side of Josephine county, Oregon, thirty-five miles below Kerby. Men are getting out ore and cutting roads to the property. A new townsite, "Wheeler City," has been laid off, and at this point, near the junction of Falls creek, smelting works are in contemplation.

SINCE the publication last week of the charges and counter charges in the bonding of the Rawhide and other Tuolumne gold mines, the matter has been settled and the suits dismissed. It is represented that N. F. Cleary has paid the costs and given up the bond, and that Nevills, Ballard and Martin have rebonded the whole property, including the Tuolumne ditch, to E. W. Fielding, of London, for $2,000,000 for 30 days, a forfeit of $50,000 to be paid by July 1st.

THE following statement of the Tacoma Smelting and Refining Co. for May, 1895, is furnished by the Tacoma Chamber of Commerce: Number of men employed, 59; payroll, $5166.06; wood choppers and teams, $848; total payroll, $6014.06. Products —3600 bars bullion, 369,178 lbs., containing: 1862.12 ozs. gold, at $20.67, $38,490.02; 39,173 82 ozs. silver, at 67 cts., $26,246.46; 366,364 lbs. lead, at $3.07½ per cwt., $11,265.69; total, $76,002.17. Duty on imported ores paid to custom house, $2,667.43.

REPRESENTATIVES of 32,000 shares in the Bodie Mining Co. met last Wednesday at 319 Pine street, to voice their dissatisfaction with the directory and find out why the stock has dropped from $4 a share to twenty-six cents. General fraud was alleged, brokers were charged with "duplicity," and the management was unanimously condemned. The annual election is next Monday, when an effort will be made to get a majority of the 84,000 shares to unite on a new board of directors.

THE big Montana copper mining organization known as "the Anaconda" will reincorporate next Saturday as "The Anaconda Copper Co.," with a capital stock of $30,000,000, divided into 300,000 shares. The present capital stock is $12,500,000. The company now employs 8000 men, and the reorganization means augmented activity. The incorporators are the company's attorneys. It is understood that J. B. Haggin, the Hearst estate and other prominent stockholders will retain their holdings in the new corporation.

E. A. ABADIE, formerly of Grass Valley, sends the half-yearly report of the Wemmer Gold Mining Co., of Johannesburg, S. A., of which he is general manager. The net profit for the six months ending Feb. 28, '95, was over £33,000. Forty stamps in 171¾ days crushed 29,535 tons ore, an average of 4.3 tons per stamp per day. It cost 28s 10½d per ton to work the 49,573 tons ore mined; the cyaniding of 19,250 tons cost 4s 10d per ton. The receipts for the half year were 23,358½ ozs. gold, worth £83,026, and 800 tons concentrates, £16,091.

UNAFFECTED by the debris question hydraulic mining in Trinity county goes on satisfactorily. At Oregon Gulch the French company has 14½ miles of ditch, carrying water to the La Grange, and, in addition to the half-million already spent, have in contemplation the expenditure of about $250,000 more. Another enterprise, owned largely in France, is being carried on at Junction City. The ditch from Canyon creek is having its capacity enlarged from 3000 to 6000 inches. An electric light and power plant is being put in and a telephone line built.

AN Arizona writer, discoursing of "dry placer mining" in some parts of the Territory, says: "The placer machine is built on the principle of a fanning mill, eight feet long, and two men shovel the sand into the mill, and in this way handle many tons per day. When the sand don't pay this mill is taken down in sections and put on the back of a jackass and moved to a richer spot. It can be set up and put in running order in five minutes. San Domingo is one of the main placer camps. In a radius of a few miles there are over 100 men working the dry washer. The old custom still prevails. No mining locations are allowed—everybody for himself."

THE following are details of results of cyaniding concentrates at the Crown Reef Gold Mining Company, Witwatersrand, South Africa:

1894.	Assay value. Dwts.	Theoretical extraction. Per cent.	Actual extraction.	Cost. s.	d.
October	23	90.21	73 14	8	11
November	18.37	89.76	84.92	8	0.7
December	17.00	91.17	91.13	8	0.3
1895.					
January	15.25	91.80	91.67	7	3.3
February	13.75	89.09	87.86	7	11.88

Time, 13 days' treatment; about 125 pounds of cyanide was used per ton of concentrates treated.

THE Nevada City *Herald* says: A week or two ago it looked as though a big mining deal would be made here, when Messrs. Golden, Levy and Keating were bargaining for the Chapman ranch, in this district. The price set upon the property was $35,000, and it is said that this was afterwards raised to $50,000. The increase in price, or some other consideration, spoiled the trade, which is greatly to be regretted. The purchasers wanted the Nevada City's ground and works, belonging to the Gold Hill Mining Company of New York, and had they secured it, would have worked the Chapman ranch ground through the Nevada City workings. This would have made a big mine and given employment to a large number of men.

E. B. BRADEN, assayer in charge of the United States assay office at Helena, has sent a circular to the mine owners and other patrons of the office, in which he says: "The regulations of the mints and assay offices prohibit the purchase of gold bullion of less than 500 fine in gold, and of less than $100 in any one deposit. For the convenience of the public, however, this office will accept deposits of gold for melting and assaying that are 500 fine or over and of a value of $50 to $100. The same will be melted, assayed and the value determined. The charge for doing this work will be $1 for each deposit. After determining the value of these deposits, they will be returned to the depositor, or turned over to some bank for purchase and settlement."

AT the quicksilver mine at Almaden, Spain, in '94 there were mined 6680 cubic meters of ore, of which 561 cubic meters were barren. Most of this was from the crosscuts and galleries on the 12th level, and on that level most of the stoping was done during the year. The permanent work required the construction of 8309 cubic meters of masonry in the various galleries and chambers. In weight the extraction of the year amounted to 19,428 metric tons of ore and 1828 tons of barren rock. In the furnaces during 1894 there were 18,744 tons of ore treated, which produced altogether 44,521 flasks of quicksilver, representing a total weight of 1,535,988 kilos. of quicksilver, the average yield of the mineral treated having been 8.19 per cent. The furnaces ran for seven months, having been shut down through the hot season, from May to September. The highest yield reported was 8059 flasks, in December, and the lowest 2912 flasks, in October.

MEXICAN FINANCIERS say that the new mining law of that country is misunderstood; that it does not mean a new tax on mining, but a change of regulations regarding the collection of such taxes. For ten years the Mexican mints have been leased to private companies, and the Government has received no revenue from the coinage of silver and gold. The contracts leasing the mints have expired, and the Mexican Government is desirous to again control the mints. After the 1st of July the Mexican Government expects to have an income of about $2,000,000 coming from the tax on the ores and the mint tax on the bullion. The tax of $4.41 on bullion was collected by the companies controlling the mints on account of the different contracts which they had made with the Government as a lease for the privilege of coining the bullion of the country. The Mexican Government declares that the tax will virtually be less than before, but more equally distributed.

THE report of the Minister of Mines for British Columbia for the year ending December 31, 1894, gives considerable information. Some of the statistics for the year are as follows: Barkerville division—Men employed 87, Chinese and Japanese 149, average wages $3.50 and $2.50 for Chinese per day, estimated yield $66,300; Lightning Creek—Whites 27, Chinese and Japanese 100, wages $3.50 and $2.50, yield $34,700; Quesnellemouth—Whites 37, Chinese and Japanese 78, yield $26,200; Kiethly Creek—Whites 167, Chinese and Japanese 199, wages $4 to $3 and $2.50 to $1.75, yield $65,150; total for Cariboo $192,350. Cassiar—Whites 17, Chinese and Japanese 54, wages $5 to $6 and $3.50 to $4, yield $22,700. East Kootenay—Whites 41, Chinese 43, wages $3 to $3.50 and $2.50, yield $24,900; Western division—Whites 205, Chinese 3, wages $3.50 to $2.50 and $2, yield gold $67,680, argentiferous copper $73,164, silver and lead $605,534, silver, gold and copper (Trail Creek) $106,267. Lillooet—Whites 30, Chinese and Japanese 50, wages $3 and $1.50, yield $39,257. Yale: Osoyoos division—Whites 138, Chinese and Japanese 40, yield gold $65,150, silver $8,500; Similkameen—Whites 75, Chinese and Japanese 70, yield $11,805; total for Yale $76,953. Total whites employed 824, Chinese and Japanese 786. Total yield gold $393,942, silver (not including ore shipments) $8,500; adding one-third for gold carried away by private parties, the total of gold and silver is $464,566, an increase of $85,031 over 1893. The average earning per man was $283, a decrease of $21.

FROM a memorandum of the British Parliament the following information is obtained regarding the great Kaffir speculations in London: "It was only nine years ago that the English began to settle in the section of South Africa where the diamond and gold mines have since been discovered. The Dutch had previously settled there after the same fashion as they did originally in New York, when they called it New Amsterdam. About twenty Dutch farmers occupied all the section of country, whose occupation was raising cattle. The mining excitement has since drawn a white population of 60,000, and 40,000 blacks since August, 1886. Within a few years most of these lands were sold at £1 an acre, and a large part of them as low as 6d an acre. The mines established on this property have been stocked at £120,000,000, and most of them are selling at an immense premium; for instance, the Rand mines were issued at £1 a share and they are now worth £33 a share, and many of the holders expect to realize at least £100 a share. The output of gold is now 181,000 ounces per month, and with the new batteries and appliances now being erected and nearly completed, it is confidently expected that the product will reach 200,000 ounces per month. Silver is found in this country in considerable quantities, but the low price prevailing makes it unprofitable as compared with gold. This rich mining property is located 6500 feet above the level of the sea, and is extremely healthy. In the Rand Victoria mine they are now sinking a shaft to work the reef at a depth of 2200 feet."

J. L. M. FRASER, C. M. E., has made a report on the Canyon Creek, Idaho, mines to a party of prospective English buyers, in which he says the claims on the main lode for a distance of 4,000 feet have been well proved by several shafts sunk down to the 9th level, from which 88,100 tons of ore have been sold at a profit of $1,529,293. The reserves of ore above the 9th level are 173,100 tons of shipping ore, the stopes producing 35,000 tons per year, at a profit of $399,350. The shafts are sinking below the 9th level, and crosscuts will be put out south to intersect the lode at the 10th level. The width of the lode varies from 10 to 20 feet, of which from 5 to 10 feet is solid ore, and the remainder good concentrating ore. The mines are well equipped with pumping, winding and concentrating plants, at a cost of over $500,000. The workings are lighted by electricity, and the machinery is driven by water, electrical and steam power. The water rights above the mines have been located by the mineowners, and cannot be used by any other mine. The mines are well served by the Northern Pacific and Union Pacific railways, with sidings into the mines, so that transit is easy and inexpensive. By the amalgamation of these claims a great saving will be effected in the surface and underground management, also in the concentrating mills, and by using the combined water powers, equal to about $50,000 per year. The lode being a true fissure cutting through the formation obliquely, one has only to keep the ore ground well opened in advance of the stoping, and the present profits of $399,350 can be continued for many years to come. A company is being privately formed to purchase this group of mines for $1,765,000, mostly in shares, with a further $100,000 in reserve, the present profits being equal to over 21 per cent. on the nominal capital of $1,850,000.

Battery Frames.

Written for the MINING AND SCIENTIFIC PRESS by F. S. PHEBY.

One is impressed, upon visiting some of the many quartz mills of the Pacific slope, with the variety of battery frames in use and the variations which the same exhibit in height, design, position of shafting and size of timbers. In Amador county, Cal., alone, I know of at least six different designs, and have in mind two in particular, one an "A" frame with thirteen-feet battery posts, the floors of which are dark and obstructed, the feeders almost inaccessible and the cam shaft bespattered with wet ore; while the other, a knee frame with nineteen-feet posts, has every part of the battery and feeders convenient and accessible and all belting entirely out of the way. The design of a frame determines the position of the shafting, which bears with importance upon the life of bearings and belting, to say nothing of the presence or absence of menacing belts and pulleys about the working floors. The size of the frame timbers is determined by the weight of the stamp.

The knee frame, no doubt, is the heaviest and most costly, but seems superior to all, at least in solidity, position of shafting and consumption of belting. The accessible line shafting receives the most attention, the bearings are kept clean, dry and quite free from dust, while the equal and nearly opposite pulls of the main and counter belts tend to keep the shaft in good alignment. This frame also best affords an opportunity for large pulleys, which I have seen 114 inches on the line and 84 inches on the cam shafts, and practice proves that moderately long horizontal belts run without tighteners on these large pulleys wear longer and transmit with less loss than short highly inclined ones. The position of the belting overhead permits the least amount of falling particles to cut them out and leaves the floors entirely free from dangerous obstructions.

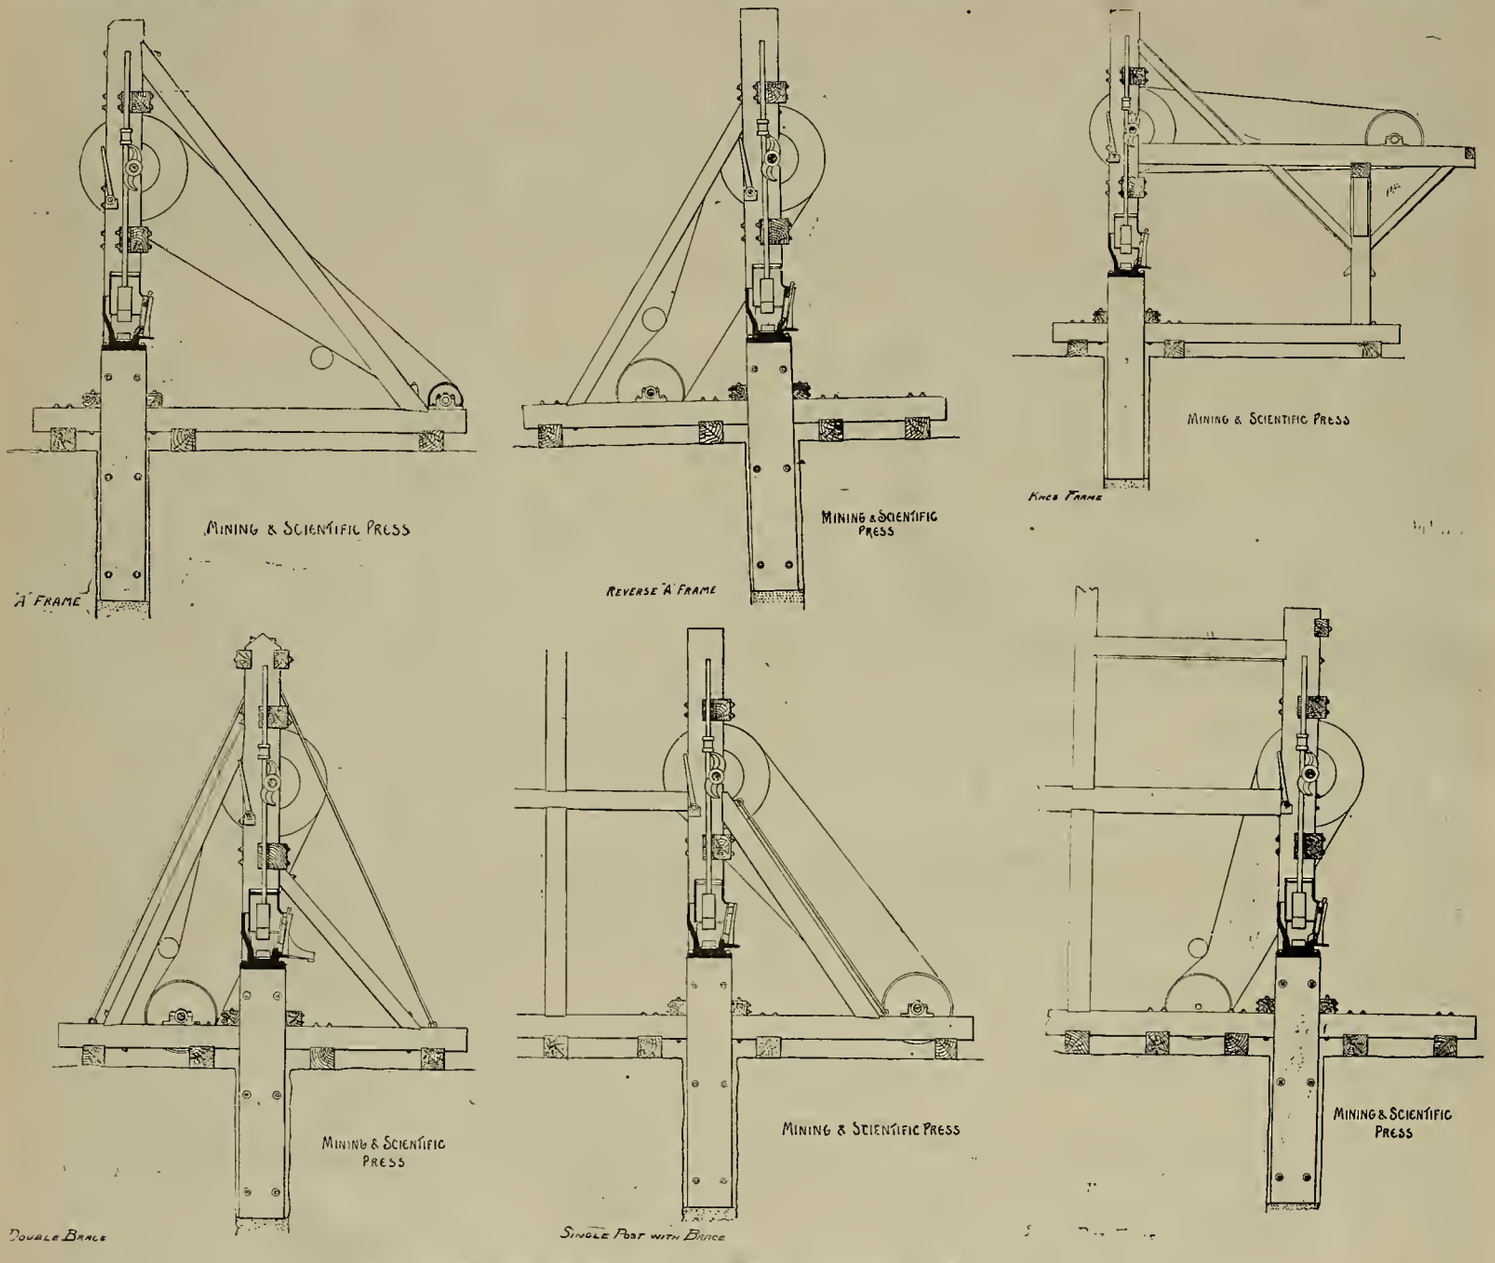
The "A," reverse "A" and "double brace" frames are commonly met with, especially in silver mills where plates are absent, and while simple and less expensive, they can be made sufficiently strong. Although the battery sills, so long as they remain sound, furnish the surest foundation for the line shaft, such a position is, in either wet or dry crushing mills, very severe on belts and shaft, the sweepings, dust and ore particles falling upon the former and more or less of the leakage through the floors upon the bearings, which in their dark, inaccessible position generally receive the minimum of attention. Whether the shafting be placed in front or behind the battery, the belting is in either case highly inclined and the distance between centers of shafting is short, even though the frame be a tall one. Short inclined belts require, on the loose side, powerful tighteners to produce the necessary friction, so as to prevent slipping on the lower or small line shaft pulleys. The horizontal and excessive vertical pulls on the main and center belts and the occasional decay of the sills sometimes throws the shaft out of line, causing the rapid wear of both itself and the belting. Generally the pulleys are small, which, together with slow speed and increased tension, necessitate a heavier belt, much less economical in cost and subsequent wear than a lighter one. Even with small pulleys considerable grading becomes necessary for a belt-way, which I have seen eight feet deep.

All that applies to the "A" applies as well to the single-post frame. This intimate connection of battery and ore biu seems a detriment, as any settling or spreading of the bin timbers reacts upon and throws the battery frame out of line. Especially is this true where large quantities of wet, gougy ore are kept constantly in the bin. I recall such a case, where the battery posts have long been out of line, to the rapid deterioration of battery and belting. Many mill builders advocate the entire independence of bin and frame.

Some frames seem to belong to no particular class, but are combinations of the few simpler forms, as the single-post with front brace. Often frames of this same class differ greatly in the height of battery posts, length of braces, etc.

A design but seldom met with is that showing the cam shaft behind the battery posts. In a double mill, with batteries placed back to back and run from the same power, it becomes imperative to build one battery of this nature as shown in the Alaska-Treadwell and the Homestake mills.

This article is not intended as a mechanical treatise, but is simply what any one might observe.



VARIOUS DESIGNS OF BATTERY FRAMES IN PACIFIC COAST QUARTZ MILLS.

Some Recent Additions to the Museum of the State Mining Bureau.

Auriferous sulphate of alumina, several tons of which were profitably worked for gold in an arrastra on Sulphur creek, Colusa Co., Cal.; J. A. Veatch.

Scolcite, Andreasburg, Germany; J. Z. Davis.

Several polished specimens of Eastern granites; J. Z. Davis.

Fine specimen of Indian carving in serpentine, ornamented boat-shaped dish or bowl. Found in a bluff on Coquille river, Oregon.

Quartz breccia, very handsome colors and taking a high polish; Monterey Co., Cal.

Native mercury in volcanic mud, from the thermal spring belt at Calistoga, Napa Co., Cal.

Gold quartz, very rich in free gold, British Guiana; W. H. Storms.

Gold in calcite, Santa Rosa mine, Mariposa Co., Cal.; E. H. Cox.

Griphite; a new mineral, South Dakota.

Chondrodite in fine crystals, Tilly Foster mine.

Chinochlore in fine crystals, Tilly Foster mine.

Cobaltite (crystal), Sweden.

Rich tin ores, Durango, Mexico.

Bismuthinite, Wickes, Montana; F. W. Traphagen.

And a number of other specimens; also about twenty-five species of fossils illustrating the cretaceous formations of Shasta and Orange counties.

HENRY S. DURDEN, Sec'y.

A Question and Answer.

To the Editor:—Please answer through the columns of your valuable journal the law governing the following case:

Blank creek carries two thousand inches of water during the mining season. A has the first and second water rights, being a high and low pressure ditch—about one hundred feet vertical height between the two ditches. A's locations call for five hundred inches each.

Can B locate above A's first right or is B compelled to go below the second right, or can B locate any water right on the stream?

I contend that as long as there are one thousand inches of water going to waste that I can locate five hundred inches above A's first right and not interfere with his full supply, etc. SUBSCRIBER.

Starveout, Douglas Co., Or., June 8th, '95.

The above was referred to Mr. J. M. Wright. The question and answer being of general interest to the mining world, are given publicity.

Mr. Wright replies as follows:

The position taken by your correspondent at Starveout, Oregon, is correct; that is to say:

Of any stream on the public lands and subject to appropriation, any one may appropriate any of the waters not already appropriated. It is necessarily implied that a later appropriator cannot diminish or otherwise interfere with the full supply of a prior appropriator.

The subject is well illustrated by the following language of the Supreme Court of California in the case of Falkner vs. Rondoni, 104 Cal. 147:

"The testimony shows that plaintiff's ditch has its head below the junction of the two forks of the stream; that during a portion of the year there is sufficient water in the stream for all the parties; that the north fork is the principal or larger branch and furnishes most of the water; that prior to 1891 plaintiff had plenty of water, or when it became short defendants, upon being notified, turned it down.

"It came, no doubt, mainly from the north fork, but this could make no difference to the plaintiff. *It was thirty-one inches of water to which he was entitled*, and he was not injured, and could not complain that it came from one branch and not from the other.

"*There was no invasion of his rights, and he had no ground for action so long as he received the quantity of water to which he was entitled.*" Yours very truly,

JOHN M. WRIGHT.

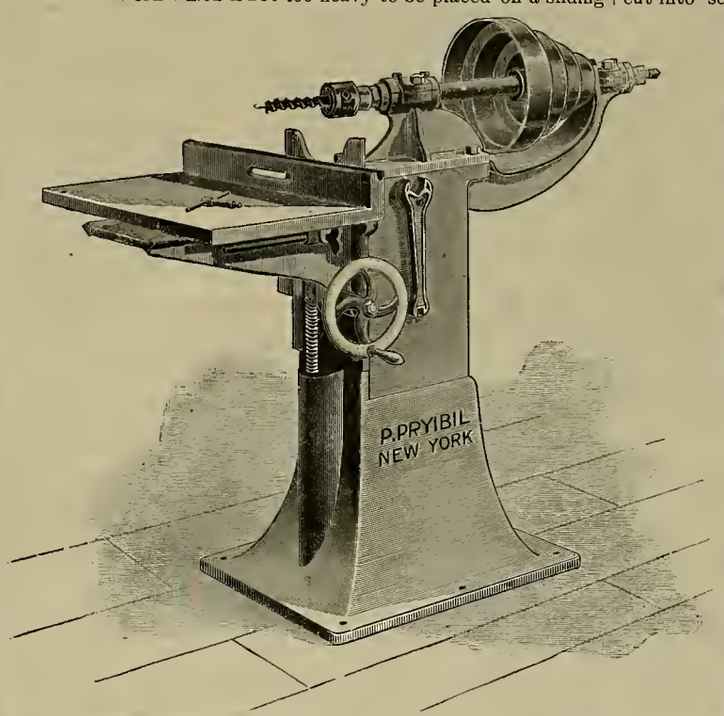
San Francisco, Cal., June 10th, '95.

Between November and May.

There has been nothing like it known on the stock markets. Nothing like what? Why, of course, the Kaffir boom. From about the end of October down to the very hour at which we write there has been a volume of business such as the mining market has never known, such as the markets generally have never experienced. Talk of American rails, talk of general Yankee securities, talk of English railways, talk of foreign loans, talk of anything you please, and the business in these has been as nothing compared with what it has been in Kaffir shares. The public in this case has been the veritable leech—crying "give, give," and the market has given, and the supply is scarcely sufficient to feed the appetite for paper that almost seems to grow by what it is fed on. The public has been prepared to part with their golden sovereigns for transfers and certificates, and in innumerable instances they have made money by the exchange. During the last two months there has been built up many an enormous fortune that would not have existed but for the Kaffir boom. The hill and country sides of days to come will be dotted with the palatial residences, the country seats, and the more moderate villas of those who, by reason of what they did between October, 1894, and May, 1895, have been able to retire from the maddening crowd, and to pursue their course, as Gray would say, "along the cool, sequestered vale of life," thanks to their dealings in Kaffir shares. For the rest of their lives they will be able to regard the weary mortals, less successful than they in the speculative race, with that pity, or that contempt, which humanity or pride may engender. They will, if humane, behold with pity, struggles in which they would have had a share but for those lucky months between October, 1894, and May, 1895. Or in their pride they will say, "What asses these people have been; if they had had our brains they would have been where we are—in our comfortable villas, in our noble mansions, in our carriages, not to say on our horses." The race is not always to the swift or the battle to the strong; and sometimes the man with very poor brains, by a series of lucky chances, gets to the top of that greasy pole of fortune, which others, in attempting to climb, have missed, and come down with a run, making their last state worse than their first. For, of course, if these enormous profits have been made by some people, there have been enormous losses made by others; and thus it comes to pass that we all prey on, instead of pray for, each other. This is a sort of homily that suggests itself to us when we see the purse-proud men we meet every day in the city, whom the tens of thousands for which they can sign checks cannot make gentlemen, because the instinct is not there. Yet are they the spoilt children of fortune, and vulgarians though many of them be, it is to these lucky ones their fellows do obeisance, without in their hearts feeling towards them the slightest atom of respect. Money has got for them everything that money can buy; but, after all, there is a point beyond which money cannot go. It cannot buy respect; it cannot make the *parvenu* a gentleman. It may command subservience, but cannot command respect; and well do these *parvenus* know it. But to many a man, out at elbow almost in November, 1894, the interval to May, 1895, has meant a rapidly acquired fortune, very possibly to be lost in the next round of speculation.—London Mining World.

Fixed Spindle Boring and Mortising Machine.

The machine herewith illustrated is designed for work which is not too heavy to be placed on a sliding table and moved up to the bit. The table has a vertical movement of ten inches, slides forward and back, and, when made for mortising, sideways also. Adjustable stops limit the extent of these motions. Mortising is done with a tool cutting on both end and side, producing, when the work is moved sideways, mortise with half-round ends. The counter-shaft has self-oiling loose and tight pulleys, seven inches diameter for a three-inch belt, and should make about 1000 turns per minute.



FIXED SPINDLE BORING AND MORTISING MACHINE.

California Clays — Stove Lining.

To the Editor:—New fields are being opened and developed for the use of several mineral products of this State—among others, the use of fire clay as a stove lining. The clay used is a species of kaolin, which is more tenacious and better able to resist fire than common clays. It is made into a dry cement by mixing with asbestos a fireproof "binding" material, and applied to the stove as a mortar. A lining thus constructed has many advantages over the old fire brick, as it fits any stove or furnace, does not crack readily, is more conveniently applied, and is much cheaper.

The great number of uses for such a cement opens a large field for California clays. Eastern products are constantly being replaced on this coast by home products simply because of their superior merits. The writer wishes to call the attention of all clay dealers to the fact that the varieties of color, weight and cohesive strength of California clays are almost infinite. Paint dealers can find any shade of clay or metallic, which can be used as a pigment. Some varieties of clay are as light in weight as their bulk in light wood, while others have a specific gravity nearly equal to that of a common brick.

California clays are cheaper and far superior to others in quality. This is one of the many illustrations which have lately become so numerous, showing that our natural resources are sufficient. All they need is development.

The completion of the San Joaquin Valley Railroad, coupled with the efforts of the Half-Million Club and the Manufacturers' Association, will eventually open the undeveloped resources of this State and place California far ahead of her present commercial rivals.

CARROLL B. SMITH.

San Francisco, June 8, 1895.

Some Practical Experience.

To the Editor:—In the interest of mining, and particularly in so far as the industry applies to Del Norte county, I desire to say that last fall I commenced operations on a river bar on the main Smith river, in this county, about two miles below the old Myrtle Creek mine, and about ten miles above the mouth of the river. I put on a No. 2 Hotchkiss giant, using 600 feet of nine-inch pipe. I took water from a small stream (Rock creek) by means of a flume. I worked in pay dirt fifty-one days and took out 35 ozs. 17 pwt. of gold and 1 oz. 4 pwt. platinum. I realized when I commenced work that I had only what might be properly called low-grade gravel, but the results were very satisfactory. I worked only two men. I made some innovations in the preparation of my sluice for saving fine gold. I bought railroad iron—that is, the common "T" rail—had them cut into sections the width of my sluice or thereabout, my sluice being twenty-two inches. I cut my rails into sections twenty-one and a half inches long, and laid in the sluice just as close as possible, and lined down the same as blocks. I had about ten feet of this kind of riffle. I carefully observed the work of the iron riffle as a gold saver, and am satisfied that more than four-fifths of the gold saved was taken from the iron riffle. I am not aware that the "T" rail has ever before been used. I am certain that it is not in common use, but any one who will be at the bother and expense of giving it a fair trial will be satisfied with its work, and its durability makes it all the more desirable. I placed my iron riffle at the head of the sluice and used six-inch blocks below, placed in the usual manner, but the "T" rail used by me was only three and one-half inches high, so that it became necessary for me to put in a false bottom in the box using the rail in order to bring the top of my rails even with the top of the blocks. The shape of the top of the rails make a perfect riffle—one that never packs and keeps the quicksilver always exposed.

Mr. Editor, I thought it only right that the miners of California should know the result of my experiment with the "T" rail, and I know of no better way of informing them than through your valuable paper. We have thousands of acres of the same kind of gravel in Del Norte as that worked by myself during the past winter. Yours very truly,

R. W. MILLER.

Crescent City, Cal., June 10th, '95.

Aluminite in Yuba Co.

To the Editor:—About two miles from this town there is a deposit of aluminous clay, and, as far as I know, it is the only such deposit in this State. The deposit was found accidentally in prospecting for copper and seems to be of very large extent. A tunnel was run 190 feet into a hill and this goes through a clay bed twenty feet wide. The clay crops out on the surface eighty feet above the tunnel at this point. About 1500 feet northwest of the mouth of the tunnel there is a shaft ninety feet in depth that was sunk in 1860 by some parties prospecting for copper. This shaft shows the clay from top to bottom. There is every reason to believe that the clay bed extends without a break between the tunnel and the shaft, and how much more there is of it nobody knows. The clay on the dump at the tunnel will average 50% oxide of aluminum. I send you some samples which were picked from the dump.

It seems too bad that this deposit cannot be made of some advantage to this section of the country. There is an abundance of wood and water at hand.

JOHN DEMPSEY.

Smartsville, Cal., May 31, 1895.

The sample sent with the above has a higher percentage of aluminum than that ordinarily received with similar communications. It is an alumnite or sulphate of aluminum, and contains 30 per cent alumina. Aluminum is widely diffused in all clays, but the silicate forms the same problem in this case that the black sand does in the case of the fine gold contained therein. In more advanced metallurgical conditions, it is possible that such deposits as the subject of the above will be utilized; but so far, the

sources of the mineral in commercial quantity are so few, and the process of extraction so comparatively complicated, that only the limonites and diaspores are found practicable.

Much has been done in this regard in the last ten years, bringing the price down from $12 per lb. to less than 60 cents, and workers in the metallurgy of aluminum deem it likely that the limit has not yet been reached.

Cyanide Practice.*

By ALFRED JAMES.

This paper deals with the following branches of modern cyanide practice: The preliminary investigation of samples, plant and extraction.

In testing works, a sample is first examined, and, if in the crushed state, panned to ascertain the nature of its contents. Ores are usually ground to pass a thirty-mesh sieve, and extraction tests are made at this fineness and compared with reaults obtained by finer grinding; tailings and concentrates are tested as received.

The usual practice is to take 1000 grains of the sample and to agitate this over night with 500 grains of 0.5 per cent solution of cyanide in a twelve-ounce corked bottle, secured to a revolving shaft. On the followiug moruing the solution is filtered off, and the consumption of cyanide is ascertained by titrating a measured part of the solution with $\frac{N}{10}$ standard Ag NO_3 solution. The sample is then washed, the remaining filtrate and washings are evaporated with litharge, and the gold in solution thus determined. The treated sample, now termed the "residues," is also assayed.

If the cyanide consumption has been heavy—say over 0.15 per cent on the ore—1000 grains of the latter are tested for acidity by means of a dilute standard solution of caustic soda. Occasionally, it is found that better results are obtained by roasting certain ores than by treating them in the raw state.

After a general idea of the behavior of the sample has been gained by the "bottle test," percolation tests are made in glasses or barrels, according to the size of the sample employed. Before proceeding to erect a plant, these small tests should be confirmed by experiments on larger quantities—say oue-half to three tons. It must be borne in mind that the consumption of cyauide is invariably greater in test experiments than in practice. It has been found iu New Zealand that in actual work only one-third as much was used as was indicated by laboratory tests, which experience has been borne out by treating tailings in South Africa. On the other hand, practical extractions are usually higher than those in the laboratory.

The plant usually consists of percolators, reservoirs, and extractors, to which, if necessary, agitators are added, these latter beiug, however, very seldom used. Sufficient percolators must be provided to carry out the operations in accordance with the result of the preliminary investigations; thus, if it is found necessary to percolate and wash for two and a-half days, and filling and emptying takes half a day, each vat will receive a fresh charge every three days; and if a plant is required to treat 100 tons per day, it will need three 100 ton percolators, or six 50 ton ones, with, in each case, one additional for contingencies; or in practice, four 100 ton, or seven 50 ton vats, as the case may be, the larger size being generally preferred.

Agitators are either cylinders with an upright shaft in the centre, to which blades are attached, or else revolving wooden barrels. The fact that all such apparatus consumes power is, however, much to its disadvantage, so that preference is very generally given to the percolation method.

Percolators are either brick and cement pits, steel vats coated with asphalt varnish (used in the United States), wooden vats or rectangular wooden tanks.

It is usual to allow thirty cubic feet of vat space per ton of ore couteuts, with an additioual depth of nine to twelve inches for filter space, &c. Rectangular tanks are made of 9x3 inch deals, tongued and grooved, and bolted together by $\frac{3}{4}$ inch bolts, and are well braced aud strutted to keep them rigid. These tanks may be of any size between 11x9x3$\frac{3}{4}$ feet and 24x16x5 fect. Most of the earlier plants were constructed of this shape.

Circular vats are made of staves from 3 to 4 inches wide, well planed, and shaped truly to the radius of the vat. The bottoms are made of 12x3 inch planks, held together by $\frac{3}{4}$ inch bolts, the vats being hooped with $\frac{3}{4}$ inch to 1 inch round iron. Filters of various materials and construction have been used. Now cocoanut matting is generally used, laid on a framework of slats, and caulked in with a ring of rope, unless vacuum suction is employed, when cotton twill or canvas is preferred for the actual filter, which is protected by cocoanut matting and wooden slats above it. Discharging doors are provided in the sides or the bottom of the vat when the sides of the latter are over 4 feet high.

The reservoirs are constructed in precisely the same manner as the percolators, except that they have no doors and no filter bottoms. They should be of sufficient capacity to contain at one time all the solutions—strong and weak—in circulation in the works. As a rule, their capacity is one-third that of the tanks.

The extractors are long boxes, or troughs, coutaining trays on which the zinc shavings are laid, the solution being compelled to pass always upwards through the successive trays by means of baffle-boards. There are usually 10 zinc compartments, each compartment being designed to hold 1 cubic inch of zinc for every ton treated per month. Thus a 2000 ton per month plant would have extractors with compartments capable of holding about 2000 cubic inches of prepared zinc, equal to a space of about 15 inches wide, 15 inches deep, and 9 inches long (in the direction of the length of the extractor). The whole box should have a fall of 1 in 20. Of the 10 compartments, only six are usually filled with zinc. In each there is fitted a tray of wire gauze of about $\frac{1}{8}$ inch mesh; the lower part of each compartment is closed by a plug, protected by an iron launder carefully locked. An extractor for a 2000 ton plant would measure 12 feet long, 18 inches wide, and 2 feet 6 inches over all. There are usually three extractors to each plant.

In addition to the above, a plant usually contains vacuum apparatus, pumps, settling tanks, pipe lines, launders, a melting furnace and assay laboratory, a lathe for turning the zinc shavings' and a proper water supply.

The ore may be wet crushed in the stamps, or dry crushed in rolls or Grusonwerk ball mills. When wet crushing is used, means must be employed to get the pulp into the percolator in a leachable condition—that is to say, that slimes must be separated out by settling-pits, buddles, spitzkasten or spitzluten, the slimes being set aside for after-treatment. If necessary, an alkaline wash is then run in, and, either with or without an intermediate clean-water wash, the "strong" cyanide solution is run on. This is usually 33 per cent of the amount of the ore, and may contain 0.3 to 0.7 per cent KCy. When this "strong" solution has been run through and the top of tbe charge appears dry, the "weak" solution, usually containing 0.05 to 0.15 per cent, is run on. Some years ago the addition of haloid salts of cyanogen was attempted, but it was found that with neither ores nor tailings was there any improvement in results, while there was an increased consumption of cyanide.

After the "weak" solution has percolated, which is usually hastened by the application of vacuum suctiou, the charge is washed with water; the amouut of such washing should be about one-third the weight of the charge, and these water washings should be run through a special extractor. The residues are then either sluiced out or discharged by hand.

Each solutiou is run by launders to its own extractor, and the contents of each, in both gold aud cyanide, are regularly tested. The reactions in the extractor are very complex, and at tbe start do not proceed as well as later on, when regeneration of the cyanide takes place to a certain extent. Many of the reactions appear to be due to the formation of a galvanic couple between the zinc shavings and the precipitated gold. The consumption of zinc is about $\frac{1}{4}$ lb. per ton of ore treated; in some cases it is claimed to be only two ounces. As a general rule the solutions leaving the extractor should assay less than $\frac{1}{2}$ dwt. of gold per ton. Under favorable conditions, this has been reduced for all solutions to under two grains per ton in regular, steady work. These figures show that zinc precipitation is effective with extremely dilute solutions. Various other precipitants have been suggested, such as aluminum, zinc dust or fume, sodium amalgam, and electricity, but with the possible exception of the latter, none of these suggestions appear to have made any headway in practice.

In cleaning up the extractor, it is first washed out with clean water, then all the gold slimes are separated from the zinc by working through a forty-mesh sieve, the cleaned zinc being put back in the first trays. The gold slimes are collected in a bag of twill, well settled, and finally fused in plumbago crucibles with fluxes that are varied according to the condition of the slimes. The slags are crushed to recover the gold they contain. The melted base bullion may be improved by granulating, giving it a sweating roast in a muffle, and remelting, when it will be bright and ductile.

Wages in the Lake Superior Copper Mines.

TO THE EDITOR:—That the expert miner who has beeu brought up in the Lake Superior iron and copper mines, where mining is doue in a scientific manuer, will not work for low wages if there is a possible chance of improving his salary, is shown by the fact of the present immigration of some of the best miners to the Western mines. The miners and mechanics leaving are principally Cornish, Irish and Germans; these have been thoroughly educated to mining work and can always command maximum pay wherever their labor is required.

That the Lake Superior miner and laborers about the mines are underpaid is not contradicted by the manager of the mines. The extra cost for fuel, light, and for heavy clothing to resist the extreme cold of this northern latitude, makes it very hard to provide for a family at any wages less than $2 per day. As it is, many laborers receive only a trifle over a dollar a day.

The Calumet & Hecla, the most liberal of all the Lake Superior mining companies, has had to retrench in the matter of expenses; and while this company did not make any reduction in wages since the 10% cut in 1893, it has curtailed its labor pay roll very extensively both by discharging a large number of men and the hiring of boys to do the work that was formerly done by men. An official who ought to know states that the average wages of employes of this great company, taking mechanics and all departments, was uow under $40 per month.

The great depth of the mines making the production of copper more expensive will probably prevent an iucrease in wages, uuless the price of the metal goes to where the mines can pay regular dividends.

A. F. ISLER.

Coast Industrial Notes.

—L. Grothwell has finally securcd a franchise for an electric street railway line in Napa.

—The Columbia Telephone Co. have begun the construction of a telephone line from Sacramento to Placerville..

—The Fair syndicate wheat stored at Port Costa, aggregating 179,000 tons, is heing loaded for sbipment to Liverpool.

—The whaleback City of Everett has been chartered by the Panama Railroad Company to carry freight between Panama and San Francisco.

—The Reward Gold Mining Co.'s quartz mill for their Inyo Co. mine, building at the Golden State and Miners' Iron Works, is ahout completed.

—The McNear shipping firm has purchased the eleven grain warehouses in the Fresno end of the San Joaquin valley formerly owned hy the Grangers.

—Commodore Mathews, Chief of the Bureau of Yards and Docks of the Navy Department, reports that the Mare Island dock can be enlarged to accommodate the largest ships in tbe navy.

—Marshutz & Cantrell are fitting up a douhle hoisting engine for a Port Blakely, Wash., lumher schooner, and this week sent a logging engine to the Miami Sawmill Co., at Madera.

—The pneumatic gun battery in the Presidio is about completed. To enahlo the contractors to secure adequate water supply the War Department has extended the time to Nov. 27th, '95.

—The Detroit Copper Company, at Morenci, has egineers surveying a railroad line from that point to Solomonville where it will make connection with the Gila Valley, Globe and Northern.

—English buyers aro hidding for all the '95 salmon they can secure, and an extonsive operator states that 100,000 cases of Columhia river salmou will find a market in that country tbis season, as compared with about 30,000 cases last year.

—A contract for 6,000,000 feet of hemlock, to he used in the manufacture of paper, has been let to parties on the Lower Columbia. It is claimed that hemlock makes a superior quality of pulp, owing to the whiteness of the fihre and freedom from pitch. Hemlock, hithorto considered worthless for almost any purpose, will now take rank with cottonwood or spruce as a pulp material.

—Tests at Los Angeles to determine could the petroleum produced there he rofined to an oxtent that would yield a profitable distillate which could ho used for stove hurners, gasoline engines and for lubricating purposes are reported to have resulted satisfactorily. It is estimated that seven-eighths of all the oil consumed in Los Angeles is produced there. The wells employ 350 men.

—The Girard Water Wheel Company, 34 and 36 Main street, this city, have manufactured and are now shipping to the Ontario, Cal., Electric Company, two 100 H. P. water wheels, to he operated at a speed of 360 revolutions per minute under an effective head of 160 feet. One of the wheels is to drive a 65 K. W. G. E. Multipolar R. R. Dynamo, and tbe other a 60 K. W. Alternator, for electric lighting.

—San Diego City wants hids for the building and sale to it of a water-distrihuting system, according to plans furnished by Capps & Shaw. That municipality also wants proposals for the sale of 1000 miners' inches of water, continuous and perpetual flow, to he delivered at an elevation of not less than 475 feet above sea level. The San Diego Flume Co. gets $107,000 annually from thc city for water service, hut new arrangements are to he made.

—According to J. D. Culp, of Santa Clara, the tobacco-growing industry of California will soon "boom." He claims that California is hound to become one of the hest tohacco-producing States in the Union. Recently ho brought the matter to the attention of the committee on new industries of the Manufacturers' and Producers' Association. Mr. Culp says he is already making hig shipments of leaf tohacco to Eastern manufacturers. Some time ago an English syndicate offered him $300,000 for his plant and mothod of curing.

—Another company has heen organized in Oakland to construct and maintain telephone lines in Alameda county. These independont companies are making matters lively for the Bell Company and forcing prices to a normal level. In the East and middle sections of the Union, local companies bave forced the Bell people to reduce their rates from 25 to 50 per cent. In some places reported—notahly at Holland, Mich.—the Bell Company made their subscribers a flat rate of $12 a year to "freeze out" local competition. Telephone charges have heen too high on this coast and must come down.

—The Navy department iuvites bids for the construction of the three torpedo hoats authorized hy the last Congress. The plans for the hoats have heen completed. They provide for construction of the fleetest craft that will be horne on the naval list. The minimum speed must not he less than twenty-six knots per hour, though it is prohable from the amount of steam power to be supplied that this limit will he surpassed hy perhaps two knots. The new hoats will be of 180 tons burden, 170 feet long and 17 feet broad. This is ten feet longer and one foot hroader than the hoats last contracted. They will have triple expansion engines and three boilers, giving 3200 horse power. For their construction Congress has appropriated $175,000 each, hut as $25,000 must be retained in the case of each hoat for its equipment with torpedo tubes and ordnance, the limit of the availahle appropriation is only $150,000 each. This is a small amount in view of the size and speed of the boats. No premiums will he allowed for speed in excess of twenty-six knots, hut there will he penalties imposed for deficiency in this respect, and this may have the effect to increase the amount of the hids. Eastern shiphuilders are harred in this competition, for, hy the terms of the act of Congress, one of the boats must he huilt on the Gulf of Mexico, one on the Mississippi and one on the Pacific coast, provided hids can he secured from these sections "at reasonahle rates," which can very probably he done.

Scientific Progress.

Telegraphing Without Wires.

A present effort is making on this coast to send telegraph messages a distance of 18,000 miles by the use of heliographs, spherical mirrors, reflecting a ray of sunlight. The most northerly station will be at the summit of Mount Nelson in British Columbia. The southern end of the line will be some mountain in Mexico. A number of heliographs will be employed and parties will be stationed on mountain tops along the line. Messages have been successfully sent a distance of 200 miles by this method, and the experimenters have no doubt of its success. The code used will be the regular dot and dash system of the Morse alphabet. It is asserted that a message can be sent this distance and a reply received in two hours.

The heliographic system has been used extensively by the signal service and many times has served an excellent purpose in conveying information of importance. This plan of flashing messages from one station to another to be repeated along the line to distant points is an improvement over the ancient system of conveying information by fires, smoke and semaphores. The heliographic outfit is as small and easily portable as a common photographic camera and can be set up anywhere. It requires sunlight to work it, but it is rapid in its operation, the signals being easily sent and received. A small key something like that of a telegraph key operates a small shutter which covers an opening in a diagram through which the reflected rays of sunlight are flashed. The messages are received by observation with the naked eye, or, where the distance is very great, by the use of a field glass.

A modification of this method is used by naval vessels where the electric light is employed instead of the heliograph.

The Value of Tests.

Unfortunately all tests are not reliable; but, says *Machinery*, in addition to the unintentional errors which occur from an incomplete conception of the requirements of the case, or from the difference in conditions too often overlooked, we find numerous instances where tests have been made with a very evident intent to deceive, either by actual misrepresentation or what is fully as bad—the omission of some important data which would greatly modify the result.

One instance recently came to the writer's notice which will serve to illustrate the latter method. Two engineering appliances, which we will style A and B, were in use in a plant where the duty was particularly severe. One gave much better results than the other, but neither all that was claimed, owing to the rigorous conditions imposed. The makers of the one (A) giving the poorer results employed an expert, who was a recognized authority, to make a comparative test for the purpose of showing the superiority of that appliance. The test in this case was decidedly against A, so the expert visited another plant where the conditions were less severe, and made a test which naturally showed more favorable results for A than the results showed by B in the first test, leaving the public to infer that both tests were made under similar conditions; and there is little doubt that many sales have been made and medals awarded on the strength of such results.

A test which does not give all available data bearing on the subject, and which is not conducted fairly and accurately under similar conditions, if for purposes of comparison, is of little value to any one.

Prof. Weber has lately given the results of a number of experiments made by him to determine the temperatures of filaments in electric incandescent lamps. He has found that the normal temperatures of all species of incandescent lamps is approximately the same, and is comprised between 1565° and 1588° C. In the case of some lamps giving a very brilliant light—that is to say, with very thick filaments—the temperature is 40° higher. —Scientific American.

Protection of Iron and Steel.

The Gesner method of protecting iron and steel from rusting is described in *La Revue Scientifique*. The principle of the process consists in forming on the surface of the metal treated a double carbide of hydrogen and iron, which is extremely hard and adhesive. In carrying out the process the articles must first be thoroughly cleaned from rust, but it is not so essential that all oil or grease should be removed from their surfaces. The treatment is effected in a pair of gas retorts, set side by side, and raised to a temperature of from 600° to 700° C. The articles to be treated are placed in a retort for about twenty minutes, when a current of hydrogen is turned into the retort and kept on for forty-five minutes. Then a small quantity of naphtha is introduced, the supply being kept on for ten minutes. The naphtha is then shut off, a current of hydrogen being turned on for fifteen minutes longer, when the process is finished. All that remains is to cool the retorts down to 400° C., and as soon as this temperature is reached the retort lids can be taken off and the product removed. The coating thus produced has a blueish color, and it is stated to be so adherent to the metal that a treated bar can be bent through an angle of 45° without disturbing it. The thickness of the protective coating is not stated.

Back Number Advice.

A homily on getting along in the world is going the rounds, addressed to mechanics, in which the well-known extract from a speech of Garfield, advising every man to have a business of his own if only a very insignificant one, was used as a sort of text. The writer evidently did not realize the fact that Garfield delivered that speech to the farmers about a quarter of a century ago. How could mechanics follow that advice without discarding their trade and learning some other means of earning a livelihood? And what would become of the great shops, railways and industrial corporations if all the artisans whose knowledge and skill they depend upon should decide to go in business for themselves, even if compelled to move to the arid West, where lands are cheap, and start a farm on the irrigation scheme? The owners would also have to seek new fields. Whether good or bad, the present system forbids such a plan. And it is as certain as anything can be that we are getting farther and farther away from the customs, business conditions and relations which made Garfield's advice wise as society and commerce were then constituted.

Dr. Deninger of Dresden has prepared carbon monosulphide CS pure for the first time, and finds that, instead of being as described in the textbooks, an amorphous red solid, it is really a colorless gas. He prepared it by heating dry sulphide of sodium with chloroform, or, preferably, iodoform, in sealed tubes to 180° C. The gaseous products were made to bubble through aqueous caustic potash, which absorbed the sulphuretted hydrogen, and the carbon monosulphide passed through unabsorbed By acting upon carbon disulphide with sodium, in the presence of some aniline, the new gas was also obtained. It is colorless, and easily condensable to a clear liquid, which, however, rapidly evaporates. It burns in air with a bluish flame to form CO_2 and SO_2. It is extremely explosive, and was only with some considerable difficulty analyzed and found to have a composition equal to CS.

Mechanical Progress.

Power Absorbed by Rope and Belt Transmission.

The Societe Industrielle du Nord de la France recently carried on a series of experiments on a large scale to determine the comparative efficiency of ropes and belts in the transmission of power. In the programme of tests, it was laid down that "with a constant resistance, and a power charged to overcome that resistance, every variation of the power must be credited to the means of transmission, which are alone capable of modifying the regime." The resistance was obtained by incandescent lamps, which were fed by a constant number of watts. The power was provided by the steam engine, and was calculated from the indicator diagrams. The output of the dynamo was measured as follows: The difference of potential at the terminals of the back of lamps was read on a torsion dynamometer which gave indications to ¼ or ½ of a volt. The current was maintained constant by a very sensitive galvanometer.

The readings were taken by the Poggendorff method of reflection, and the method was such that it was necessary to decrease the sensitiveness of the galvanometer in order to keep the spot of the light on the scale. The galvanometer was connected to two points about one meter apart on the main circuit, and was provided with a commutator by which the current in it could be reversed to correct any possible variation in the zero point. It was not sought to determine exactly by this method the number of amperes passing, but only to be certain that they were at all times the same. The net result is stated to be that ropes and belts are equally efficient organs of transmission. The difference between the best and the worst of the figures is so small that the order might be reversed in another trial from local or other accidental circumstances. It is also to be noted that both the ropes and the belts were quite new, a circumstance that would tell more severely against the latter, as they would not have time to come to a good bearing surface, and hence would need to be run at a higher tension than would be required after some days of steady work. The slip of the belts, too, would have decreased as they became more supple and lay in more intimate contact with the pulleys, and their efficiency would probably have increased somewhat more than that of the ropes, so that they would, at least, have equalled them in economy.

A "Cranky" Belt.

There are mechanics who believe that belts will sometimes get tired and cranky, and refuse to work. Whether this is actually true or not, the writer operated a little cross belt at one time that acted very much like it. At intervals of several days the belt would fly off without provocation. I would put it on, and immediately it would fly off again, and would keep on doing so for a number of times. Finally however, it would resume operations in the regular way without any more breaks, for days at a time, when it would take another fit and do the flying-off act again. I got used to it, and when it took the notion to fly off I curbed my temper, drew upon my reserve of patience, and as often as it flew off I would quietly put it on, knowing that when the fit was over it would resume work, and it always did. I did not then know what caused the trouble, and do not yet, unless it was of a cranky disposition, or was tanned from the hide of a Texas steer.

The cause of the trouble in the above case was more probably due to the repulsive force of static electricity than any cussedness of the leather, or the source from which it was obtained. A dry leather belt working on a dry pulley, where the shafting and machine are well insulated, accumulates static electricity most rapidly, and frequently sparks 10 inches in length can be drawn from the belt. As the belt and the pulley are both charged there is some repulsiveness between the two, and it is probable that with the pulley electrified and a layer of air between the belt and pully it would cause it to fly off as above related. When the electric conditions are so favorable there will be trouble with the belt. Exhibitions of "crankiness" in machines or apparatus can always be reasonably explained by well known facts.—Saw Mill Gazette.

An Automatic Typesetter.

A new typesetting machine, called the Plectrotype, for which wonderful qualities are claimed, is announced from Berlin. Its operations are automatic, the copy being fed into it in the form of a specially prepared slip of paper. A small electric motor drives each machine, which easily turns out 20,000 ems an hour. An ordinary compositor seldom sets more than one-tenth of this amount. A single boy can attend to several of these machines at once, as his duties are merely supervisory. Not only does the strip operate the keys of the machine, but the spacing is also done automatically, so that the lines come out exactly even, or justify, as a printer would say, without manual labor. The type, after being used, is distributed automatically. Copy for the plectrotype is prepared on a typewriter, which punches in the paper holes something like those required by the Wheatstone and other automatic systems of telegraphy; and corrections may be made in the matter by the editor before it goes to the machine. However, this punching of a tape is handwork, and can hardly be performed any more rapidly than the operation of one of Mergenthaler's linotypes by an expert. In both cases there is the same limitation—a human operator's skill at a keyboard. The Mergenthaler machine (an American invention) casts a line of type from little brass moulds, which are assembled by touching the keys; the new German apparatus sets old-fashioned type. It is claimed, however, that the latter machine will handle all of the ordinary sizes of type equally well, while a Mergenthaler is specially manufactured to mould brevier, minion, nonpareil or agate, and separate machines are therefore required for the various styles.

"I saw a handy contrivance for punching boiler sheets the other day, that is so inexpensive that any shop can well afford to have one," says J. H. Allen in *Dixie*. A track of light rails was laid on the floor in front of the punch, and on this traveled a carriage of such height that a sheet, placed upon it, laid on the proper level for punching. Bolted to the floor is the rack with teeth of a pitch equal to the spacing of the rivet holes. On the carriage is a dog that drops into and engages with the teeth of the rack. One man pushes the carriage ahead one notch at a time and draws it back until the dog is solid against the tooth of the rack at each stroke of the punch. Another man stands ready to stop the punch should the first man fail to get the carriage in adjustment before the punch descends on the next stroke. In this way a sheet can be punched as rapidly as the punch will work, and each hole will be properly spaced and in alignment. For changing the pitch of the rivets it is only necessary to change the rack beneath and each sheet is adjusted for a line of holes as soon as it is clamped in position for the first hole. There is no necessity for a large gang of men being kept busy at the punch; two can do the work in about one-third the time consumed in the ordinary way with a gang of four or five. Of course it is essential that the wheels and rails shall be true, that the dog and rack shall be carefully machined; but other than this the apparatus requires no special care in its manufacture.

Electrical Progress.

Highest Efficiency of Galvanic Batteries.

Henry Morton, Ph.D., has a practical article in *Cassier's Magazine* for June, on the maximum possible efficiency of galvanic batteries. He refers only to that class of galvanic batteries shown by experience to be the most efficient in supplying large currents, and says:

In all the batteries here referred to, there are the following common features: 1st, The energy is derived from the combination of zinc with dilute sulphuric acid; 2d, The supply of oxygen required for this combination is obtained by the decomposition of water or some other compound in aqueous solution.

The source of energy being the reaction between the metallic zinc and the dilute acid, its amount can be expressed in British thermal units as follows: Oxidation of zinc, 2340 B. T. U.; solution of oxide in dilute sulphuric acid, 666 B. T. U.; or, in all, 3006 B. T. U. as the total energy developed by the union of the zinc and acid. No arrangement of parts or employment of one material or another in other parts of the cell or for other parts of the reaction can add anything to this, but on the other hand there must always be more or less subtracted from it to meet the demands of the reaction, to say nothing of internal resistance of the solutions, local action, etc. In order that the zinc should combine with the acid, the hydrogen, whose place it takes, must be driven out or otherwise taken care of, and this will demand an expenditure of energy, greater or less, but always considerable. For example, in the Smee battery the oxygen is simply driven out in bubbles of gas. To do this requires 2106 B. T. U. for each pound of zinc dissolved. Taking this from 3006, leaves only 900 B. T. U. as even possibly available from each pound of zinc consumed in a Smee battery, not counting losses coming from local action, resistance, etc.

This difficulty was realized at an early period and was met by supplying oxygen to take up the hydrogen, and so avoid the great loss involved in expelling it. To supply this oxygen, various substances have been used, but the only ones of practical importance are sulphate of copper, nitric acid and chromic acid. But even with these, more or less energy must be expended in decomposing them and securing their oxygen.

Such a rate of consuming zinc as a pound a minute would, of course, require an immense galvanic battery, and indeed it is usual to express the consumption of fuels generally in pounds per hour. To get the horse power due to the consumption of zinc at the rate of a pound an hour, he gives some figures which indicate the horse power developed by a pound of zinc consumed during an hour as follows:

Smee battery	0.35, or about	⅓ H. P.
Daniell battery	0.55, "	½ "
Grove battery	1.06, "	1 "
Poggendorff battery	1.14, "	1 17 "

Showing that in the best forms of battery an allowance of one-horse power for each pound of zinc consumed per hour would be a liberal one, if something is allowed, as it must be, for the resistance, local action, etc. He concludes by saying: It may, however, be asked: If such an improvement has been made as above shown from the Smee battery give ⅓ to the Poggendorff yielding 1⅓-horse power, may we not expect further improvements as great in amount? To this I answer certainly not in this class of batteries. The entire energy of the reaction between the zinc and dilute acid is 3006 British thermal units. This would represent 2,320,632 foot-pounds or 70.62-horse power for one minute, or 1.17, say 1¼, horse power for one hour, and this would be an absolute maximum which could never be reached, far less exceeded.

Of course, if we could use some other, and more efficient, reaction than that between zinc and sulphuric acid, some gain might be secured, but nothing of that sort has ever been accomplished, nor from what is known of the combining or thermal equivalents of the available elements, is much to be expected in that line. At all events, we may well accept this as a certain fact, that in any known form of galvanic battery the round figure of a pound of zinc per horse power per hour is an outside figure for efficiency, and when anyone asserts that more than this has been secured, there is certainly some mistake or fraud.

Waste in Electric Stations.

Every electric light or power station, whether large or small, is provided with a steam plant which contains a number of engines and a number of boilers. To make the plant flexible, and adapt it to the variable load, a multiplicity of units seems a necessity. The steam plant, or a portion of it, is in operation, as a rule, night and day during the whole twenty-four hours, and two or more gangs of attendants are employed to care for it. There are boilers enough under fire and steam to supply the plant when called upon for its maximum output, and a sufficient number of engines are kept warmed and ready for duty to meet the ordinary requirements of the service and any unforeseen emergency caused by change of weather or extra demand. One of the rules of electric-light operation is that the power must be "on tap," as it were, whenever it may be called for, and every attendant is imbued with the importance of this idea. Under these circumstances, how does the man who shovels the coal and handles the dampers of the boilers, or the man who starts and stops the engines and controls the valves of the station, perform his duties? If these men follow the natural bent of workmen in their positions, the result will be this: A greater number of boilers are maintained with live fires than are needed for the moment, and those not required for immediate use are thrown out of active service by opening the fire-doors and closing the ash-pit doors, leaving dampers open and coal on the grates in the active condition of burning. Dependence is here placed on the cooling produced by the inrush of cold air to the furnaces and deadening of the effect of the fires to prevent too great generation of steam. This practice certainly checks the generation of steam, but it does not stop the consumption of coal. That goes on, though at a reduced rate, the resulting heat being carried off with the air to the chimney. In the same line, the boilers which have banked fires are left with draft on and doors wide open, thereby causing a more rapid combustion of the bed of coal in the bank than would otherwise occur, and, what is worse, cooling down the boiler and its contents through the introduction of the cold air. The loss of heat thus caused must be made good by burning new coal when the boiler is again set to work. There is no need of thermal storage tanks to prevent the waste caused by these practices. Proper oversight of the firemen and the right sort of instruction on these points is sufficient.

The engineman has a different class of duties. His great object is to have the engines ready in time and keep them in reliable operation. One important foe he has to fight is water in the steam. He must keep the pipes well drained, run the engine long enough when first starting without load to insure free pipes and free cylinder; and there is no guide save judgment to show him when this condition is realized. The result is that engines are run a longer time underloaded than the legitimate light load of the station represents, and generally longer than needed for the purpose in view. During the preliminary running drips of steam pipes and cylinders are, as a further precaution, kept wide open, which adds much to the wastefulness of the practice. Furthermore, when the engine is out of use, the drips are left open to a greater or less extent so as to keep the pipes drained, and too often the drains of the engine pipes, and of the main system of piping of the boilers as well, are without adequate trap protection. The matter of how the drips are handled is one which is often lost sight of in many kinds of steam plants beside the electric, but it is important everywhere, and it provides an avenue of waste which is frequently serious. In the electric plant it is peculiarly liable to be important, owing to the exigencies of the service. The loss from careless handling of drips bears a much larger proportion to the legitimate output when the load is small, as much of the time occurs in electric work, and for this reason waste in electric plants is liable to be extravagant where the matter is neglected. It should not be understood from these statements that the thorough drainage of water from the pipes and cylinders is uncalled for. It is in reality one of the most important matters in the care of engines. With the unthinking enginemen, however, it may be abused, and it is the abuse of the practice which is the cause of much of the waste in electric stations.

D. McFARLAN MOORE, an electrician of Harrison, N. J., one of these days expects to sell sticks of light the size of a stick of candy, that will outshine rays of sunlight and remain illumined for forty-eight hours without replenishing their burning qualities. These light sticks, he intends, shall completely revolutionize the science of illumination, and are to be carried in the waistcoat pocket and connected with a button, which it will be only necessary to press to secure a bright light. Mr. Moore declares that his invention is in accordance with a new principle in molecular vibration. It required much study to discover it, and could not be improved by even the secret process of the firefly. Mr. Moore proposes to emulate the glowworm, however, and, instead of having the present filament in the ordinary incandescent light, he will make the entire surface of the glass glow with brilliant light, and without any heat whatsoever. He further alleges that he is able to separate the several divisions of energy and employ only the illuminating elements. He employs the ordinary current of 110 volts, and from this he gets a light that compares very favorably with sunshine.

M. RENAULT has recently devised a neatly arranged dry battery. Each cell consists of a carbon vessel, in the bottom of which is placed chromic acid mixed up with gelatinous silica, this latter possessing the remarkable property of absorbing sixty times its volume of water. On the top of this jelly a disc of porous earthenware is laid, which supports a zinc spiral immersed in a second layer of gelatinous silica, this time without the addition of the chromic acid. The cell is claimed to be very compact for its power.

WORKMEN are engaged in Corvallis, Or., in placing the 100-horse power boiler in position at the electric light works.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from John B. Rathburn et al in the Lost Camp mine, near Blue Canyon, Placer county, to impound tailings behind brush dam in Wood's Ravine; and from A. J. Mason, in the McFadden mine, near Mokelumne Hill, Calaveras Co., to impound tailings behind rock and brush dam in Buckeye gulch, gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., June 17th, 1895, at 1:30 P. M.

MICHIGAN MINING SCHOOL, Houghton, Mich. A high grade technical school. Practical work. Elective System. Summer courses. Gives degrees of S. B., E. M. and Ph.D. Laboratories, Shops, Mill, etc., well equipped. For catalogues write to the Sec'y. M. E. WADSWORTH, Ph.D., Director.

CAPITAL WANTED
To develop Gold Lode Claims. No reasonable reliable offer refused. Call on (or write) A. W CALLEN, Walnut Grove, Arizona, to see the property, or address owner, P. N. TAYLOR, 82 Superior St., Cleveland, Ohio.

A THOROUGH AND RELIABLE
Quartz Mill Man and Assayer
DESIRES POSITION. Capable of taking full charge; unexceptionable references. Address MILLMAN, care MINING AND SCIENTIFIC PRESS.

TAUGHT BY MAIL THOROUGH PRACTICAL

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

Founded by Mathew Carey, 1785.

HENRY CAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS AND IMPORTERS.

810 Walnut St., Philadelphia, Pa., U. S. A.

Our New and Revised Catalogue of Practical and Scientific Books, 88 Pages, 8vo., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the arts, sent free and free of postage to any one in any part of the world who will furnish his address.

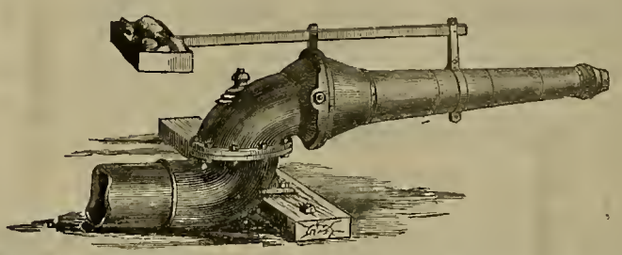
DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

Correspondence Solicited. Send for Catalogue.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL NOTES.—*Republican:* A. Hayward has commenced work on the Hazard quartz mine.

The miners who recently quit work on the Mayflower and other claims on account of their wages being in arrears, have heen paid six per cent of the amounts due them last Saturday.

D. Gutman has an option on the Massa quartz mine, for $10,000.

Calaveras.

GENERAL ITEMS.—*Herald:* J. Waltman has shut down his mine on account of the exhaustion of the water supply. He is in this city to get an engine, and, with steam for power, will resume.

Three to five dollars a day are heing taken out of the Moyle mine at Wade's flat. So far they are straight down 100 feet and 50 feet on an incline.

Colonel Shaughnessy, who closed down tbe Baumhogger mine a few days ago, will arrange for the erection of a sinking plant for that property.

L. Waggoner is looking over the Carley property at Altaville with a view to putting up a chlorination works there. He claims to be able, with this process, to make a saving of $4 per ton.

Del Norte.

CINNABAR.—Crescent City *Record:* The recently discovered cinnahar mines on Diamond creek, a short distance heyond the North Fork of Smith river, on the old Wimer wagon road, is attracting considerahle attention among the citizens of this place.

Kern.

AMALIE MINING DISTRICT.—[Special Cor.]—The Picnic Mining Company are haviug a milling test made, for which purpose they have hauled twelve tons of ore to the Amalie Company's mill. The result will be known in a few days. This mine was discovered about two months ago and from numerous assays taken the ore will run about $100 per ton.

The Amalie Mining Company have put on a night shift. They are now down a little over 200 feet, and have put in a new gasoline hoist. With a day and a night shift they expect to do some very rapid sinking during the next few months. This company struck a new eighteen-inch shoot of shipping ore the other day, the richest ever taken from this remarkable mine.

Messrs. R. E. and Henry J. Dull have discovered and located a mining claim, which they call the Mayflower. It is situated about one-half mile northwest of the Amalie and from it has been taken some very good ore. This is another result of careful, faithful prospecting. G. E. F.

Mariposa.

GENERAL NOTES.—*Gazette:* The Branson five-stamp mill, on Cotton creek, was not completed until May 8th, and only a few days' run was made, owing to a lack of water for power. The parties interested have two mines, in which the ore runs from $6 to $14 per ton. They will take out considerable rock this summer and will run the mill steadily during the coming winter, unless they should conclude to put in steam power.

At the Santa Rosa mine grading has heen done for the mill site. Men are taking out rock and getting ready to put the property on a producing hasis.

Nevada.

THE EAGLE BIRD.—At Eagle Bird mine thirty men are employed. The ledge shows gold and galena sulphurets. The thirty stamps work continuously.

THE CALIFORNIA MINE.—The *Telegraph* is informed that the California mine has begun work, and that the Evening Star (Seven-Thirty) mine shows rich ore. It is expected that the crushing will be done at the California mill, which is near by.

GENERAL NOTES.—*Tidings:* The Harmony mine distributed over $3000 on its pay day, last Tuesday.

The Bellefontaine is producing some extremely rich ore. A quantity taken from the 600-foot level is good for $200 or more per ton.

Herald: Twenty-five extra stamps are to be put up at the Mayflower mine. Twenty of them will he brought over from Forbestown, a contract having been let for the hauling over of two ten-stamp mills from that place. It is evident that the Mayflower is looking well.

Plumas.

MINING NOTES.—At the Thistle Shaft, gravel drift mine, 140 men are employed.

Thirty men are employed at the Slate Creek tailing claim, La Porte. The tailings are raised hy hydraulic elevator, which carries a steady stream of water, tailings and gold from the bedrock into the gold flume, situated on the hank of Slate Creek, some twenty feet or more perpendicularly above its hed. The usual difficulties attendant upon the employment of new appliances and methods were met hy this company in getting their elevator to bedrock last season. These have heen overcome and it may he expected that a highly remunerative run will he made this year as the elevator works well, carrying the grit up hill to the flume as fast as it can he brought to it.

At the American, Washington Hill, Charles Walters of Gihsonville has a number of men at work getting out timber fcr a dump house. The channel in this property was recently tapped at a point sufficiently low for stripping an extensive area of bedrock.

Mr. Stevens is preparing to put in restraining works at Sawpit.

The Donalsdon quartz ledge, on Onion Valley creek, will be thoroughly prospected this season, by Mr. Sumner, who has employed four men for that purpose.

GENERAL NOTES.—*National-Bulletin:* John Lawrence has hought the H. C. Leighty mine near Granite Basin, and has hegun development work.

At the Christie mine Superintendent Dillon has fifteen men employed.

Mr. Benjamin of Oakland, has purchased the Cooper & Sullivan quartz mine, and has let a contract to run a tunnel for development purposes.

The old "Mexican" quartz mine has been honded hy a San Francisco company represented hy J. A. Hall, who is preparing to begin operations immediately.

Riverside.

GENERAL NOTES.—*Record:* Dr. J. W. Reese has let a contract to sink on the Kimherly mine, on the east side of the valley.

J. D. Moulton, at his Hillside mine in the Rice district, has men at work running a tunnel.

Connection is expected to he made the coming week hetween the shaft and the 700-foot tunnel in the Santa Fe mine. When this is done the company will begin taking out ore and start up the mill.

The shaft in the Golden Chariot mine is now down 215 feet and it will he sunk 150 feet farther, when drifting will he pursued. Drifts forty feet deep have heen run at the 215-foot station and good ore has heen encountered. A steam hoist will he put in operation.

At the Santa Rosa thirty-three men are employed. The directors are considering the advisahility of sinking the main shaft to a depth of 1000 feet. If this be done it will make the Santa Rosa the deepest gold mine in southern California. The shaft is now down 300 feet. The mill is turning out bullion to the amount of $10,000 a month.

Conditions at the Good Hope have not changed. Mill and mine are hoth shut down, and it is prohahle they will remain so for some time to come.

San Bernardino.

CLAIMS SOLD.—J. V. Brighton, who located several claims in the Morengo district, north of Indio, last March, has lately sold them to Butte county men for $15,000, who intend to put in a mill, and claim to have enough ore in sight to cover the price they paid for tbe mines.

DROP INCREASED.—The drop of stamps in the Vanderbilt Bronze mill has heen increased to ninety drops per minute. Smelting ore is heing taken out of the 150-foot level of the Gold Bronze mine.

Shasta.

GENERAL NOTES —W. R. Conant has struck a six inch vein on Portuguese flat.

L. Wolleh of this city has leased the Hope mine near the Tower House with the privilege of huying and has men at work running a tunnel.

Mr. Hascall who recently honded several properties in Mule Mountain District, will soon put a force of men to work developing same.

Charles Toser is at Old Diggings, to examine the Reid group of mines, for Hayward & Lane.

E. C. Brown, the mining engineer, is at Dog Creek, examining mines for an English syndicate.

LOOKS AS THOUGH PAINTED WITH GOLD.—*Fress Press:* The owners of the Eureka Tellurium Gold mine, at Middle Creek, who last week discovered a rich hody of ore at the bottom of their shaft have this week discovered a still richer hody of ore. The face of the ledge has the appearance of having heen painted with a brush dipped in gold.

THE GLADSTONE.—The Gladstone, at French gulch, has made another clean-up of hullion $21 fine. Mr. Brightman is considering the matter of burning crude oil in his engine, as wood is getting scarce, causing an expense of about $20 per day.

Tuolumne.

GENERAL NOTES.—*Independent:* The Mooney mine, which adjoins the Trio on the south, will shortly begin work. Rich ore was formerly taken out of this mine.

Development goes on in the Oliver & Harris mine. The ledge is eight feet wide and gives an assay of $7 per ton.

At the Rappahannock the shaft is 300 feet deep. No crosscutting will he done till the mine has attained further depth. The sinking is very good. The ore hody now heing pierced is of low grade, but on the hanging wall, and to the east, is the east vein, where a rich shoot is known to exist, as demonstrated hy the old south shaft, from which formerly rich ore was extracted, but heing too near the surface the owner has decided to sink the new shaft, to the north, a considerable depth before tapping the shoot.

At the Dead Horse the quartz is well sprinkled with free gold, carrying three per cent of arsenical sulphurets and ahout one per cent of galena. This find is at the 1300 foot level, north of shaft. Principally all the work of development is confined to this end of the mine. The ore from this shoot is being milled. The Superintendent is making preparations to sink helow the 1400 foot station. Drifts will be run north to intersect the ore hody now found at the 1300, as ahove described. The general average of the rock pays about $8 in free gold, in mill.

Work has begun on the Soulsbyville which is being reopened from an air-shaft to the south.

The Black Oak mine made a rich strike this week at the 600-foot level. The owners are ahout erecting a reverberatory furnace to calcine their ore; latterly, they have, in a crude way, been making outside kilns, and burning the ore, which has proved a success, which suggests a more complete method of calcining. This system liberates the gold from its base embrace, thereby permitting it to be amalgamated.

The Louisiana mine at Cherokee, west of the Eureka vein, in early days, produced rich free gold, hut in depth, most of the free gold passed into the base metals. Messrs. Hall & Howe are unwatering the shaft, 300 feet deep.

NEVADA.

WASHOE CO.

COL. LOW'S REPORT.—Col. J. B. Low has made a report on the Brunswick lode, in which he says in part: The Brunswick lode is located in Storey county, Nevada, ahout 7000 feet east of and parallel with the Comstock, which is a twin vein formed at the same time and with many of the characteristics. At the northern or Monte Cristo development we find a great outcrop of quartz with strata of pay ore from three to twelve feet in width. Much of the ore has heen mined out perhaps to a depth of 100 feet and has paid from $10 to $20 per ton, 50% of which was gold. This work was done by parties under lease, and in a temporary manner. A heavy flow of water caused a suspension, hut not until something like $500,000 had been extracted. The prospect is of great merit, and now that the Sutro tunnel has thoroughly drained the fissure of water, mining should he commenced in good form. Passing south from the Monte Cristo we find a few test pits showing the continuance of the quartz croppings, and traces of gold and silver; hut the first development shown is in the prominent outcrop on a point making down the hill on the Bailey claim. Here tunnels have heen run at slight depths, and ore of paying grade extracted, also a large irregular opening has heen mined from the surface. I learned that some $50,000 or $60,000 had been mined here mostly hy gambocinos and trihuters.

The fissure maintains its width for perhaps 100 feet, with its porphyry walls. A strong upheaval or dyke of andesite also appears on the surface slightly to the east of the vein. At the St. John's mine, which lies directly over and crosses the Sutro tunnel, which cuts the vein at right angles 1350 feet below, many thousands of tons of ore have heen quarried from the croppings of the veins and mined from a tunnel which cuts the vein at slight depth. The vein is fully 100 feet in width, and has been opened by surface excavations and lateral drifts from tunnels ahout 200 feet on the vein.

Thousands of tons of ore that will pay a profit mostly in free gold can be mined from the surface. Passing on to the south, we find hold outcrops of the great wide vein on the North Occidental, giving promise of ore when intelligently prospected. A little farther south we encounter the old surface workings of the Occidental proper. With all this I have been familiar for many years, in fact at one time during the good days of the past (when I was at the mine) several good mills were kept running on ore from this part of the Occidental mine.

During that period a tunnel was run at some depth helow, and the vein mined successfully. Later a deeper tunnel was run, tapping the vein ahout 550 feet vertical, helow the old upper workings, and leading out and on a level with tbe Occidental mill. Through this tunnel I entered and inspected all the points of interest in that part of the mine, the most important of which is a vein of good ore which has lately heen encountered in a west crosscut on the 550-foot level. A winze has been sunk on this ore some 40 feet, and the pay vein continues and is now about four feet wide in the hottom, and carries about $40 in gold and silver, is well sulphuretted quartz, quite free from lime. The appended certificate of assay hy Prof. Price is from a large sample of the hest ore. A drift or crosscut also cuts this vein of ore. There is plenty of evidence in sight to warrant me in recommending a more vigorous prosecution of the exploration of the great mass of quartz and spar between the east and west walls, which are fully 200 feet apart in this part of the fissure. The property is in good order, with a first-class mill conveniently located, also excellent buildings, etc., for accommodating workmen. The rock is exceedingly hard. One wonders why so fruitful a vein should he allowed to drag along for years without air drills and other improvements of the age. A single-handed hammer pounding a drill-head in such a vast field of vein matter is bad economy. Mr. Kinkead, the present superintendent, has shown much ability in every department. Having passed judgment to the best of my ahility on the surface—upper works—I was taken to a point where the Sutro tunnel crosscuts the Brunswick vein and exposes a body of quartz more than 120 feet in width carrying traces of ore.

A drift has been run here in the Brunswick vein southerly, known as the Zadig drift, possibly 1000 feet. I was unahle to reach the face, a cave having broken the air pipe and cut off ventilation. So far as inspected, only occasional suspicions of ore are visihle; this is also very much the case at the same depth (1344 feet) in the Comstock lode, and had we cut that vein on the same level before developing the ore above I fear we might have missed several hundred millions of dollars worth of ore.

In conclusion, the Brunswick lode is within a mineral zone. It is a very strong vein of good matrix and carries both gold and silver for the entire length from the Monte Cristo on the north to the Occidental on the south. In every place where the vein has been worked to any extent pay ore has heen obtained. At all times when work was attempted heretofore too much water was encountered to render it practicahle to mine ore of low grade. The exceptional richness of the ore found in the Comstock vein attracted capital away from other promising prospects in that vicinity. The entire Brunswick vein, and all veins encountered, are now freed from water by the Sutro tunnel, thus enabling owners to work the mines for about 50 per cent of the former cost.

Samples from the Occidental winze, on the 500-foot level, prove conclusively that rich ore exists at that point in paying quantities, and samples brought with me from every other point mentioned fully justifies all the foregoing conclusions.

OREGON.

JOSEPHINE COUNTY.

COPPER DEPOSITS.—Large copper deposits are said to exist in Josephine county, thirty miles south of Grants Pass, at the mouth of Falls creek on the west bank of the Illinois river.

A. M. Brown has bonded eighteen claims on the creek and brought Geo. F. Wbecler from Baltimore, who hought an interest in the claims, and on returning to Baltimore organized the Siskiyou Mining Co. and sent out the necessary capital for Mr. Brown to commence development work with and to put in the necessary machinery for a test.

They are now opening the mine in two places, hy tunneling, and getting out ore which is said to run from twenty-two to forty-five per cent pure copper.

At present twenty-two men are at work.

JACKSON COUNTY.

TO BE SOLD.—Sheriff Patterson will sell the Ashland mine July 6th to satisfy judgments against the property by Kinney & Provost, $9988.60, with $1200 costs; T. K. Bolton, $2305.30 and $5500, with $570 costs and attorney fees; a total of approximately $20,000 judgments. Four claims are embraced—the Nutshell mining claim, the A. N. King mining claim, the Patton extension of the A. N. King and the Rogers & Roach claim.

WASHINGTON.

AT LOOMIS.—The Rush Mining, Milling and Smelting Company has heen absorhed by the Chapacca Mining and Milling Company; on June 1st they shut down all their workings to arrange their affairs, consequent on the death of the president of the company.

BRITISH COLUMBIA.

AROUND NELSON.—Nelson *Miner:* At the Poorman the ten stamps are putting through only about ten tons a day just now as a certain amount of dead work has to be done. At Forty-nine creek, "Our Company" has got the hedrock flume laid nearly to the point at which it will cover enough ground to save the handling of the houlders which takes so much time at present.

A feeling of confidence in the return of good times is making itself felt, especially hy the owners of gold claims on Toad mountain and the adjoining hills.

MONTANA.

MONTANA'S MINE SIGNAL CODE.—State Mine Inspector Shoemaker and Deputy Inspector Miles have compiled a code of mine signals, which takes effect June 15th. The full code is as follows:

SIGNAL BELLS.

1 Bell hoist, 1 Bell stop (if in motion).

2 Bells lower men, 3 Bells hoist men.

4 Bells hlasting signal, engineer must answer hy raising bucket or cage a few feet and letting it hack slowly. Then 1 Bell hoist men away from hlast.

5 Bells steam on, 6 Bells steam off.

7 Bells air on, 8 Bells air off. 3-2-2 send down drills, 3-2-3 seud down picks.

9 Bells danger signal (case of fire or other danger), then ring number of station where danger exists. No person shall ring any signal hell except station tender, except in case of danger or when the shaft is heing sunk. Engineers must slow up when passing stations when men are on the cage.

STATION BELLS.

2 Bells, Pause, 1 Bell	Station No 1
2 Bells, Pause, 2 Bells	Station No. 2
2 Bells, Pause, 3 Bells	Station No. 3
2 Bells, Pause, 4 Bells	Station No. 4
2 Bells, Pause, 5 Bells	Station No. 5
3 Bells, Pause, 1 Bell	Station No. 6
3 Bells, Pause, 2 Bells	Station No. 7
3 Bells, Pause, 3 Bells	Station No. 8
3 Bells, Pause, 4 Bells	Station No. 9
3 Bells, Pause, 5 Bells	Station No. 10
4 Bells, Pause, 1 Bell	Station No. 11
4 Bells, Pause, 2 Bells	Station No. 12
4 Bells, Pause, 3 Bells	Station No. 13
4 Bells, Pause, 4 Bells	Station No. 14
4 Bells, Pause, 5 Bells	Station No. 15
5 Bells, Pause, 1 Bell	Station No. 16
5 Bells, Pause, 2 Bells	Station No. 17
5 Bells, Pause, 3 Bells	Station No. 18
5 Bells, Pause, 4 Bells	Station No. 19
5 Bells, Pause, 5 Bells	Station No. 20
6 Bells, Pause, 1 Bell	Station No. 21
6 Bells, Pause, 2 Bells	Station No. 22
6 Bells, Pause, 3 Bells	Station No. 23
6 Bells, Pause, 4 Bells	Station No. 24
6 Bells, Pause, 5 Bells	Station No. 25
7 Bells, Pause, 1 Bell	Station No. 26
7 Bells, Pause, 2 Bells	Station No. 27
7 Bells, Pause, 3 Bells	Station No. 28
7 Bells, Pause, 4 Bells	Station No. 29
7 Bells, Pause, 5 Bells	Station No. 30

ELECTRIC BELLS.

Where electric bells are used in connection with other bells, use the following signals:

If cage is wanted, ring station signal. Station tender will answer 1 Bell.

Reply, 1 Bell to go up; 2 Bells to go down.

If station is full of ore and station tender is wanted, ring station signal and do not answer hack.

If 2-1-2 Bells are rung, engineer or station tender does not understand; repeat signal.

In case of danger or accident, ring station signal; station tender will reply 3-2-1, ring 9 Bells.

One copy of this notice should he posted on the gallows frame, and one before the engineer.

C. S. SHOEMAKER, State
JOHN MILES, Deputy. Mine Inspector.

QUARTZ VS. PLACER.—The commissioner of the general land office at Washington has made an important ruling in a quartz vs. placer suit which was tried in the Montana courts one year ago, resulting then in a judgment for the lode claimants.

Some time in 1881, John Noyes and others obtained a patent to a placer claim in this county. Peter Ross and others filed on it as the Bonanza lode. The Helena land office rejected the application because the location was entirely within the patented placer. An appeal was taken to the general land office,

and the commissioner in his decision says the refusnl of the Helena office to file the application was in accord with the practice of the department, hut cites a recent decision in the case of the South Star, in which the former departmental decision was overruled. The commissioner says:

"A placer patent does not operate to convey any lode or vein situated on the ground entered, which was known to exist at date of the placer application, because, by the express terms of the placer patent, all such known lodes or veins are excepted from the grant. As no title to a known vein can be passed by a placer patent, the fee simple to such known lodes continues to reside in the United States until it parts with the same in accordance with law, and consequently the United States continues to have jurisdiction over all such known lodes or veins, and therefore this department may entertain and consider applications for patent therefor, notwithstanding the outstanding placer patent.

"From said decision in the South Star case I quote: 'And it is now held that, when it has been ascertained by inquiry instituted by the department, or determined by a court of competent jurisdiction, that a lode claim existed within the boundaries of the land covered by a placer patent, and that such lode claim was known to exist at the date of the application for such patent, and was not applied for, the land embraced in said lode is reserved from the operation of the conveyance by the terms thereof, and patent may issue for such lode if the law has been in other respects fully complied with.'

"The important, material and controlling question in such cases appears to be: Is there within the limits of the patented placer a lode or vein which was known to exist at date when the placer application was filed? In the case at bar, this question is conclusively answered by the finding of the district court.

"It is therefore held and decided that, at the date when the placer application was filed, the property known as the Bonanza lode was a known vein or lode; and that, because of this fact, the title thereto still vests in the United States, subject to disposition under the provisions of the law relating to lode mining claims.

"For the reason that since your decision was rendered the department practice in such cases has been modified, your decision is hereby reversed, and the record returned, and you are directed to file and consider contestants' mineral application."

UTAH.

THE IBEX.—*Tribune:* The deal by which the Ibex Mining Company acquired temporary possession of the Ibex mine, in Detroit district, is off, and on Monday next work will be resumed by S. F. Mount and his associates, to whom the property has reverted.

Few deals in mining have undergone more vicissitudes than that from which the Ibex has just issued. The company having procured the option upon it for $135,000, the development of its resources was begun, and since taking possession some 500 feet of work has been performed, and about 3000 tons of ore marketed, that showed a valuation of $40 gold, and from three to ten ounces silver and seven per cent copper. Of the purchase price $45,000 has been paid, and this, by a series of defaults, beginning on January 1st, when $20,000 only of the $36,000 payment that was due was paid, is all forfeited with the mine.

COLORADO.

CRIPPLE CREEK.—*Mining Industry:* In a little region of country covering not to exceed twenty square miles there are nine towns, and every gulch has its cabins and houses, and every hill its shaft houses and prospect holes by the thousand. The population is estimated at 20,000—the number of producing mines at ninety or more. No one knows how many value-produeers there are, and no one can anything more than roughly estimate the holes which are being dug. They number into the hundreds. In some places the hills are covered with men.

Probably no other camp in the world possesses the physical features shown at Cripple Creek. The hills are rounded, grass-covered, timbered only in a few spots, and covered with debris or slide varying in depth from five feet upward. The veins, except occasionally in granite, do not crop to the surface, so that the prospecting is all "blind." Men take leases in grass plots, where there is no evidence of veins or ore, and dig holes hit and miss, or dig trenches, hunting for veins. Generally they succeed in finding some, because veins are very thick there, and they run in every direction. These veins are generally small—perhaps contraction fractures formed when the melted rhyolite cooled. Some, however, are strong and long, permanent veins. These veins appear to have some close relation to dykes, formed after the overflow of rhyolite, and are often contacts between the dykes and enclosing rocks. The deepest workings in camp are about 600 feet below the surface, and the stronger veins show no evidence of exhanstion. What change there may be in the ore when the true veins pass from the overflow of rhyolite into the underlying granite no one can tell. There is reason to believe that it may not be for the worse. It is known now that the veins outcropping in the granite carry very rich ore. An evidence is seen in several, most notably in the Independence, which probably carries the largest body of high-grade tellurium ore ever found.

Most of the ore is not at all adapted to the stamp mill or amalgamation process. It is doubtful whether the stamp mills which have been running there have saved on an average more than twenty-five per cent of the values, with one exception, which sizes and treats its tailings by a method of concentration well adapted to them. That method is to run them, after sizing, through a 45-mesh screen, over a stationary, wide inclined table covered with canvas. These tables are washed with a hose every few minutes, the concentrates they have gathered being collected in a trough.

The cyanide and chlorination methods are both used successfully. They buy ore which carries less than five ounces gold per ton, paying $19 an ounce for the gold and charging $8 per ton treatment, and they are running full and constantly, treating on an average approximately 200 tons daily. This includes the purchases of the mill at Florence.

ARIZONA.

ORO BLANCO DISTRICT.—*Citizen:* Warsaw camp has been abandoned, and silver mines are no more sought. Around the old camp new gold properties are being opened. A good gold porphyry lead was recently found right in the excavations of the mill. The outlook for the district was never better. The Old Glory mill will enlarge its plant to fifty stamps. The Montana and the Yellow Jacket are in full blast. The Austerlitz mill will soon be humming again, with redoubled vigor. The Orn and Julia mill foundation is being built and the Tres Amigos and McDonald group people each declare they are going to have mills shortly. Prospects are also good for a mill on the Boston and St. Patrick properties.

ALMOST INCREDIBLE.—*Our Mineral Wealth:* The Temple gravel beds, on the Colorado, report a cleanup from bedrock of $33.75 in gold to the yard of gravel.

LOWER CALIFORNIA.

Speaking of the receipts of gold dust and bullion from Lower California, the San Diego *Union* says: "There is $40 in gold brought to this city from Lower California to $1 received from mines in this county. Some of the richest specimens ever seen by old miners have lately come from the peninsula, where rich strikes are continually being made, and the predictions made some years ago regarding the enormous mineral wealth of Lower California appear to have better foundation than ever. Gen. Humphrey and H. E. Wood, who some time ago started to reopen the old San Fernando copper mine below San Quintin, are about to establish a smelter of about fifty tons capacity at some central point, probably at San Vicente, between Ensenada and San Quintin, and convenient to Socorro and Valladares.

MEXICO.

THE EL PIOMO.—The Nogales *Oasis* says the El Piomo Mining Company, whose extensive properties are located in the Altar district, about sixty miles from Santa Ana, Mex., contemplate ore reduction on an extensive scale. During the past two years operations have been confined to development work, and there are now 50,000 tons opened for extraction. The ores are carbonates of iron and lead carrying gold and silver. It stated that 18,000 tons of ore from this property, smelted at Nogales, yielded an average of $20 per ton gold, 12 ounces in silver and 22 per cent lead.

Railway Construction in the Peruvian Andes.

There are no public roads in Peru on which vehicles can be used except in the vicinity of Lima, the old roads made by the Incas all over the part of South America which tbey controlled being only for foot passengers and llamas, says J. R. Maxwell in a recent paper. They were generally well arranged for grade, but the location was bad. The Spaniards made little improvement in roads, although they built some good stone bridges over the larger streams. There is a good wagon-road from Lima to Callao, and these were all the ways of communicating with the interior until about tbe middle of this century, when the first railroad was built. It extended from Callao to Lima, about 7½ miles, was used for passengers only, and was very profitable. The work on it was ligbt, and the total cost not over $150,000. Another road was built from Lima, about eight miles long, to Chorillos—a summer resort on the Pacific ocean.

Late in the sixties tbe Peruvians saw how the Chilians were opening up tbeir country with railroads, and became anxious to develop their own in tbe same manner. The Government had a large revenue from the sale of guano, of whicb it had a monopoly, and easily floated a loan in England and organized a system of public works. A number of roads were projected, several of which were to cross the Audes; but the great number were only local, reaching in from tbe coast to some productive locality. A survey made to ascertain the expense of extending the railroad from Mollendo to Islay, only six miles along the coast, showed that it would cost $1,500,000.

Tbe board of public works, composed of engineers, some educated in this country, but most of whom had studied in Europe, fixed tbe standards for maximum rates of grade, minimum radii of curves, minimum lengtb of tangents between tbe curves in opposite directions and the rate of compensation on curves, with some of the details of construction. The maximum grade was fixed at 4%. On curves of 120 meters radius the grade was fixed at 3%, wbile witb 600 meters radius no compensation was required, and between these limits the rate was made proportional. The minimum length of tangents on curves turning in opposite directions was made 30 meters. The standard road-bed was 14 feet wide; cuts, 16 feet at sub-grade; tbrough bridges, not less than 14 feet in the clear; tunnels, 15.75 feet at the springing line of the arcb aud 18 feet higb inside; minimum thickness of masonry lining, 16 inches. Tbe gauge of most of the roads was 4 feet 8½ inches, but tbere was oue road of a meter gauge and a small one of 3 feet 6 inches. The contracts for most of these roads were let in 1869.

Mr. Maxwell describes in detail the construction of the roads from Chimbote up the valley of the Rio Santa, 165 miles to Recuay, and the Southern system—the largest in Peru—consisting of tbe road from Mollendo, 107 miles, to Arequipa; from there, 218 miles, to Puna, and auother, from Juliaca, 210 miles, to Cuzco, of whicb only 112 miles are finished. The road from Juliaca runs nearly due north and crosses the summit of the eastern range at an elevation of 14,200 feet. When finished, the lowest elevation on the Cuzco branch will be 10,500 feet above tide-water.

Tbe most celebrated of the roads is the Ferro Carril Central del Peru. Starting at the docks in Callao, it keeps rising until, at 106 miles from the coast, it reaches a height of 15,666 feet (about that of Mount Blanc). It tben descends, and in thirty miles falls 3489 feet. When completed 264 miles farther, it will reacb the navigable waters of the Amazon, and this extension will probably not cost more than half as much as the finished portion. There are eight switchbacks on tbis road, four of them being double. There are fifty-seven tunnels in a distance of twenty-four miles, mostly through rock spurs. Work was begun on tbis road in 1870, the track being laid to Chicla in 1875. It was resumed in 1890, and track was laid into Oroya on June 10, 1893. All of this work was done at an altitude above 12,000 feet, the most difficult and important of it containing tbe two largest bridges and eight of the tunnels being above 15,000 feet.

John Taylor & Co.
Importers and Dealers in
Assayers' Materials,
Mine and Mill Supplies.
Also Chemicals, and Physical, School and Chemical Apparatus.
63 & 65 First St., Cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc. including, also, a full stock of Chemicals.

We have frequently second-hand Assay Balances on hand which are generally as good as new for actual work. We thoroughly readjust them.

We have now on hand the following:

One No. 12 Oertling, Price, - $100 00
One " " " - 125 00
One Froemner, No. 2, Price - 50 00
Two Becker's No. 16 Pulp Balances, each, 15 00

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45 horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain Apply to JOHN H. GILLESPY, 1908 Stockton St., San Francisco.

Mining Share Market.

SAN FRANCISCO, June 13, 1895.

The mining share market does not share in the business improvement manifest elsewhere. Depressed in value and diminished in quantity, the little business done is but a semblance of the past. The interest felt in the yet-to-come Hale & Norcross decision was eclipsed this week by the attention given the Brunswick scheme, which has so far been endorsed by the seven companies who have held meetings relative thereto. The purchase has been approved, the companies also adopting a resolution that "the purchase of the Brunswick lode is not to be construed as an indication of an abandonment of the Comstock lode, or a lack of faith in the further successful development of that lode."

It was stated unofficially on Thursday that instructions have been sent to Virginia City to begin work on the Brunswick at once.

It is reported that Thos. H. Leggett, superintendent of the Standard Con., of Bodie, has resigned to accept a big salaried position in one of the Rand mines, South Africa.

The following illustrates the changes of the week:

Assessment Notices.

GOLD BAR CONSOLIDATED MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, La Porte, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of May, 1895, an assessment, No. 1, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of June, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, Cal.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of June, 1895, an assessment, No. 2, of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the corporation, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 27th day of July, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eleventh day of June, 1895, an assessment (No. 19) of Five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the sixteenth day of July, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the sixth day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the twelfth day of June, 1895, an assessment (No. 45) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine st. cet, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth day of July, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the seventh day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine St., San Francisco, Cal.

BIDS ARE ASKED

For Renovating and Enlarging the Pump House of the undersigned, in the Pearson district; for Driving Piles; Concrete Work; New Cross-Compound Engine **Bids opened July 6, 1895.** For particulars apply to

P. & B. INSULATING TAPE. ARMATURE VARNISH. ELECTRICAL COMPOUND.

STANDARD OF EXCELLENCE—USED IN ALL FIRST-CLASS ELECTRICAL WORK.

Samples and Circulars on application.

PARAFFINE PAINT CO. 116 BATTERY STREET, SAN FRANCISCO. 221 SOUTH BROADWAY, LOS ANGELES.

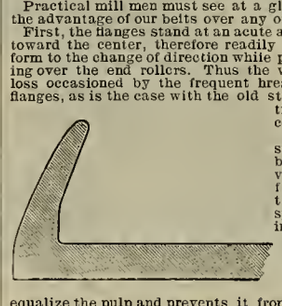
Sole Manufacturers of P. & B. Paints, Roofing, Building Papers.

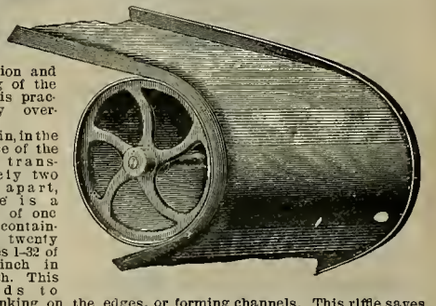
Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.





Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

H. G. BLASDEL, JR., Manager,

419 California Street, Haywards Building ..... **San Francisco.**

THE AMERICAN MINING & MILLING MACHINERY CO.,

121 Euclid Ave., CLEVELAND, O. 280 Caxton Blk., CHICAGO, ILL.

SPECIALTIES:

AM. CRUSHER AND AM. BALL PULVERIZER.

The simplest, cheapest and best machines in the market. Pulverize wet or dry to any degree of fineness. Make little or no slimes in wet nor dust in dry work. Four sizes, capacity from 2 to 60 tons per day.

SEND FOR CATALOGUE

Cable Address, American.

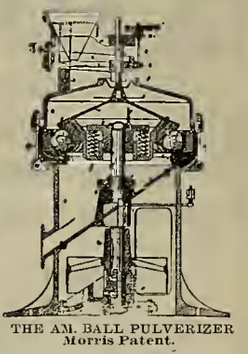
First Prize and Gold Medal Awarded by World's Fair, 1893.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out hair-stones rapidly. We find that the steel balls which were when new 5 in. in diameter, now caliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

CLEVELAND IRON ORE PAINT CO.



THE AM. BALL PULVERIZER
Morris Patent.

REGRINDING VALVES

Reasons why LUNKENHEIMER'S are the best.

On the market for over **35 years.** Made of **Gun Metal** throughout. Every valve tested and warranted. Can be reground while on pipe. Easily taken apart on account of outside thread and union style connection, therefore no "cementing" of hub to body. In long tried use on **Government Vessels, Lake and River Boats, in Rolling Mills, Refineries, Factories, Mills,** etc. **Gun Metal** is the only composition that will stand the screw power of valve stem and make a steam joint., Superior and more durable than valves with **Asbestos or Rubber Discs.** TRY them and be convinced. None genuine unless "LUNKENHEIMER" is cast in the shell. Specify and insist upon "LUNKENHEIMER'S." Catalogue gratis upon request.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PIPE.—Henry F. Williams of San Francisco, assignor to the Improved Asphalt Company of Bakersfield, California. No. 540,202. Dated May 28, 1895. This pipe is made of independent annular rows, each row consisting of a plurality of wooden segments, the segments in adjacent rows breaking joints and all adhering together by means of a suitable glue.

AIR BRAKE BRANCH PIPE DRAIN CUP.—Walter K. Conness, Sacramento, Cal. No. 540,539. Dated June 4, 1895. The object of this invention is to provide a protection for the delicate mechanism of the triple valve of an air brake to prevent the entrance of dust when the pipes are disconnected. It consists of an enlarged or bottle-shaped casing having the smaller end connected with a T or passage to the train pipe, an annular enlarged chamber at the opposite end adapted to receive dust and foreign substances entering the chamber, and having a dust receptacle connected with the lower side thereof, a pipe from the triple valve casing entering through the center of the enlarged chamber and extending into the interior beyond the dust chamber, a screen cone fixed upon the inner end of the pipe, and a solid conical button fixed to the smaller end of the cone at the entrance to the chambor so that the air and dust are diverted to pass along each side of the screen cone and air pipe.

COIN-CONTROLLED APPARATUS.—Gustav F. W. Schultze, Berkeley, Cal. No. 540,195. Dated May 28, 1895. The device belongs to that class of apparatus in which a disk is rotated by the deposit of a coin, acting through suitable intervening mechanism, the disk indicating, by its spinning and coming to a state of rest, a desired result or a failure to reach such result. The inventions in the present machine consist in improved details of construction, the general object of which is to render the machine more accurate, more attractive and less susceptible of misuse.

AUTOMATIC TIRE INFLATER.—Philip W. Stanford, New York. No. 540,519. Dated June 4, 1895. This device belongs to that class of automatic bicycle-tire inflater in which the necessary pumping operation is dependent upon and gained by the slight compression of the tire at the point of its contact with the ground. It consists of a valve-controlled cylinder flexibly mounted on the wheel, whereby it may yield under an unequal strain imposed upon its piston rod; a valve-controlled piston in the cylinder; a hollow piston rod communicating with the interior of the tire and bearing against the inner surface of its outer wall, whereby it is moved up, and a spring within the cylinder for returning the piston. In addition, there is also a dust-arrester upon top of the cylinder, and by this the air is properly filtered before being admitted to the cylinder, so that the latter will not become clogged.

DOOR BOLT.—John E. Armstrong, Santa Cruz, Cal. No. 540,532. Dated June 4, 1895. This inventiou relates to the shooting bolts intended to be used independently of a door lock. The object in view is to provide a simple and cheap device which can be readily applied to the door, can be locked and unlocked by means of a key from the outside, and can be positively locked against the action of said key when desired. The device consists of a slidable bolt having a handle, a recess or chamber formed in the door and leading from the recess in which the bolt works out through the inner side of the door; a plate covering the recess and having a curved guide in which the handle of the bolt works, said recess or chamber extending below the handle of the bolt and adapted to receive the bit of a key, whereby said bit, in rising up on either side of the handle, causes a reciprocation of the bolt; and a pivoted stop on the plate adapted to be turned into and out of the path of the handle, whereby the bolt is locked against the action of its own key and is again released.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

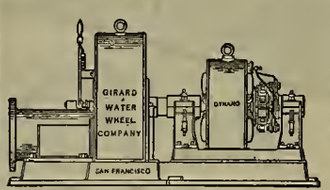
Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,
121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Girard Water Wheel Co.,

34 MAIN STREET, - - SAN FRANCISCO, CAL., U. S. A.

WATER WHEEL

CASCADE WATER WHEEL

Adapted to all heads, from 30 FEET TO 2000 FEET. Our experience of 33 YEARS in the water wheel business enables us to suit every requirement of water power plants. Send for illustrated pamphlet. This new wheel has given an unequaled Economy in Water.

Marine Engines.

The renewed interest in marine engines on this coast, the great lakes and the gulf makes timely illustrated reference to some styles that attract deserved attention.

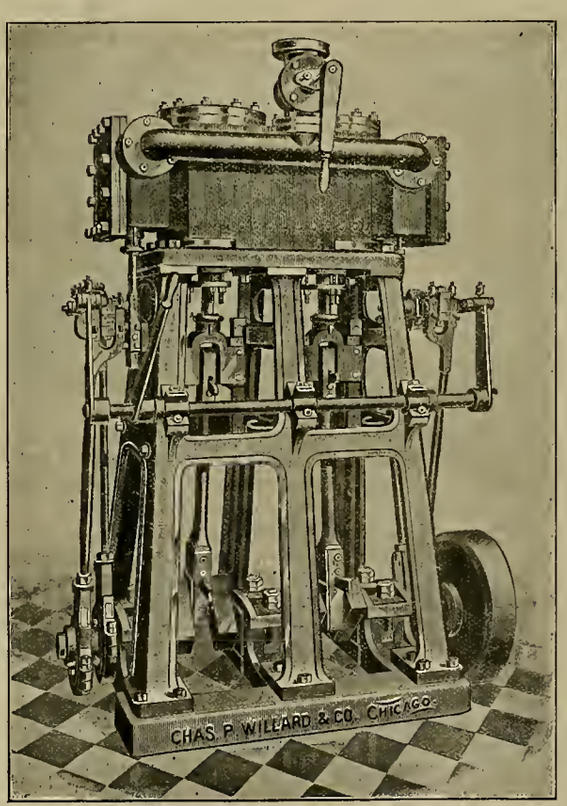
The steeple compound engine shown in the engraving is 8 and 16x8, compact, taking up little room in the boat, and equal in efficiency to corresponding sizes of fore and aft compounds. In smaller sizes the high-pressure cylinder rests directly on the low-pressure cylinder cover, the piston rod working through a bronze sleeve.

The illustration of the yacht engine, open-frame style, shows a type of marine engine popular with yachtsmen, on account of its simplicity and the great accessibility of its various parts. One side of the frame is of cast iron, with locomotive slides; the other side is supported by a wrought steel column, leaving one side entirely open and free of access.

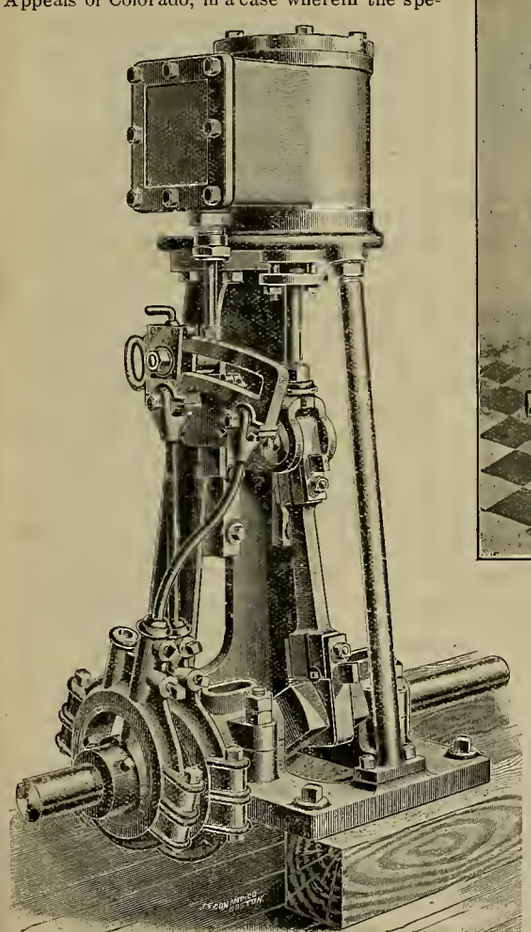
The cut of the 65-foot steam yacht graphically depicts a style of craft that combines the useful and the ornamental in an eminent degree.

The illustration of the duplex high-pressure marine engine shows style of frame of fore and aft compound engine as usually built.

SIXTY-FIVE-FOOT STEAM YACHT.



DUPLEX MARINE ENGINE.



YACHT ENGINE, OPEN-FRAME STYLE.

In the case of Hagerman vs. Bates the Court of Appeals of Colorado, in a case wherein the specific performance of conveyance of a mining claim was the question at issue, has decided that "specific performance of a contract to convey part of a mining claim will not be decreed where it appears that when the contract was made the value of the land was unknown, but was possibly, if not prospectively, great; that the parties now seeking performance waited two years after the other obtained a patent and deed should have been made before bringing suit; that they were then advised that their claim was disputed, and deed would be refused; that they permitted the suit to lie dormant five years, when they filed an amended bill; that in the meantime the others developed the mine into a very rich one, and that transfers were made without objection, and permitted work to be prosecuted without taking any steps to restrain trespassers or assert their rights; and that even after filing amended bill did not prosecute their suit with reasonable diligence. The mere fact that suit was brought within reasonable time does not prevent application of the doctrine of laches, where there is a want of diligence afterwards."

The Victoria, B. C., *Colonist* reports that a vein of free-milling gold ore has been found 16 miles from Vancouver. In North Vancouver there are deposits of iron pyrites running $6 and $7 gold to the ton. It would cost about $8 to extract the gold. In Professor Dawson's report on the mineral lands of British Columbia it is stated that gold had been taken out of Seymour creek in paying quantities, but work had been afterward abandoned on account of the great expense of getting the gold from the creek, the bed of the river consisting of boulders buried beneath several feet of quicksand.

The South African mine owners have taken many of our best California gold miners, and whenever they want a man to successfully manage one of their properties they naturally look this way. They have a very seductive argument, offering the man they want considerable solid inducements. Robert Curnow, who used to be a Nevada county miner, of late years engaged at the Treadwell mine, Alaska, is one of the recent acquisitions. He says: "It is a long distance, but the inducements held forth are so tempting that I have accepted." Mr. Curnow will get $10,000 a year, house, board, servants, horses, etc. The company will pay his passage both ways if he should desire to return within two years.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Yacht Engine, Open-Frame Style; Duplex Marine Engine; Cross-Compound Engine; Sixty-five-Foot Steam Yacht, 398. Isabella Incline, Cripple Creek, Col., 393.

EDITORIALS.—Marine Engines; Specific Performance of a Contract to Convey Part of a Mining Claim; Free-Milling Gold Ore Near Vancouver; California Gold Miners for Managers in South Africa, 389. Suspension of Assessment; The *Record-Union's* Misstatement; The Famous Land Office Rules; President Dickie's Paper at the Technical Society; Foreign Ownership of Mining Properties in California; The Mineral Land Fight, 390. Montana Mining Law, 391.

MECHANICAL PROGRESS.—Correct Costs, or the Parallel Column in the Counting-Room; Self-Hardening Steel, 395.

SCIENTIFIC PROGRESS.—Probable Source of Helium; Telephoning by Means of a Beam of Light, 395.

ELECTRICAL PROGRESS.—The Pennock Electric System; Niagara Power Scheme a Failure; The Harrison International Telephone Company; The Leadville Electric Power and Irrigation Co.; The Suburban Electric Road Idea, 396.

PRACTICAL INFORMATION.—Decline of Natural Gas; Oil on the Waters; Primitive but Effective; Pittsburg and the Smoke Nuisance, 400.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 398-99.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 402.

CORRESPONDENCE.—Timbering in the Isabella Incline; The Calumet & Hecla, 392. Buying and Selling Mines; Girard Water Wheel in Power Development, 394.

MISCELLANEOUS.—Concentrates, 391. Troy No Longer the Center of Production of Stoves; Development of Water Power at Minneapolis; Wagon Frames in Leeds and Chicago, 392. The Mineral Hydrocarbons; Treatment of Pyrities Without Roasting; Krushite; Ballasting Upon the Southern Pacific roadbed; The Greatest Labor Union in the World; Why Oil Barrels are Painted Blue, 393. Coast Industrial Notes, 394. Notices of Recent Patents, 403.

THE PRESS doesn't want any miner to forget for want of being told that the suspension of assessment of '93 and '94 does not apply to '95, and that to hold an unpatented mining claim in any State or Territory in the Union $100 worth of work or improvement must be put thereon some time between January 1st and December 31st, 1895, inclusive.

THE Sacramento *Record-Union*, inaccurate as usual, says that at the recent meeting of the Executive Committee of the Cal. Miners' Association, a proposition was made by the Railroad Co., and declined, and then goes on for a column or so using the allegation as a text. The assertion is about on a par with that paper's recent utterances. The fact is no proposition was made. A gentleman present said he was authorized to make a proposition; that was all. This being the case, what becomes of the elaborate argument of the *Record-Union* based on the false statement?

AT the time the famous land office rules of July 9, '94 were published the PRESS was informed, not officially, but in a way that was almost authoritative, that the real intent was to compel dilatory holders of mining claims to secure U. S. patents. 'Twas thought then that, like Providence, Mr. Smith's department moved in a mysterious way its wonders to perform, but it was believed then and since that it is no part of governmental function to punish poverty or push the dilatory, and that the real reason was to pave the way for the wholesale grab that is now being made, whereby the railway corporations seek to absorb unjustly so great a part of the mineral area of the commonwealth.

AT last week's meeting of the Technical Society of the Pacific Coast President Dickie read a paper on "Engineers; Consulting, Inspecting and Contracting—Their Relation to Each Other and to the Public," which was generally discussed. Among several other good points made in the discussion of Mr. Dickie's clever paper, was the one that rarely, if ever, in works of fiction was an engineer portrayed as dishonest, and whatever other trade, calling, vocation or profession ascribed to "the villian" of the novel, he was not designated as an engineer. The same honorable fact holds good in the realms of fiction regarding "the honest miner." Few, indeed, are the plots or plays in which the miner appears as a maleficent individual, and their names are legion of works of popular fiction, both read and acted on the stage, where the miner, in deeds of daring or benevolence, is the hero and central figure of the plot.

The Mineral Land Fight.

During the week it has become evident that the other ten protests filed by the California Miners' Association against railroad selection of mineral lands will be dismissed the same as the one reported in last Saturday's issue, on the same technical construction—"not specific." These protests cover 600,000 acres of mineral land. Land Commissioner Lamoreaux allows sixty days for an appeal to the Secretary of the Interior. The appeal papers in the first case of 24,900 acres in the Los Angeles district have been forwarded. It denies Commissioner Lamoreaux's jurisdiction; shows that, according to the rules made by the Secretary of the Interior, it is maudatory on the Commissioner to order a hearing whenever such protest is received; and argues that the matter is not within the jurisdiction of the Land Department, and that the whole thing is *ultra vires*. In case Secretary Smith dismisses the appeal, which is very likely, the matter will be again brought to the personal attention of President Cleveland.

At the meeting of the Executive Committee of the Association in this city on the 6th inst., Secretary Ralston said that in some individual cases in which he was personally interested he was going to fight the matter in the courts. This is probably what it will come to at last. These great questions always result in adjudication by some court of last resort, the same as the whisky trust or the Income Tax law, and, though tedious, it is probably the surest way to make direct issue and secure final result.

The question is a simple one: which is dominant, the railroads or the law? If the former, it is probably as well to have it authoritatively stated; if the latter, the sooner it is determined the better. The administrators of the law seem singularly unanimous in the belief that the railroad's interests are supreme; it is time now to see what the interpreters of the law think about it. There are three branches to our Government—the legislative, executive and judicial. In this case of the people vs. the railroad corporations the legislative enactmeut was very plain for the miner, the grant that gave so great a slice of the public domain to the railroads expressly excluded mineral land. So far that was all right. But the well meaning law makers only form one branch of the trinity of governmental power. The executive department stepped in, and in July, '94, a code of rules of procedure was adopted that undid the work of the law makers. The Secretary of the Interior may be "unawed by influence and unbribed by gain." Probably he is honest. But he and his subordinates in the Land Office are doing, perhaps out of goodness of heart, what is worth a great deal of money to the railroad company to have done just the way it is being done by the Government officials—the executive branch of the Government. There is one remaining department of the Governmeut—the judiciary. That is supreme, dominating the other two. To that the people have never yet appealed in vain. To its decisions, whether favorable or unfavorable, all must give assent. It is to this tribunal that the miners of California will finally submit this case for final determination. Protected by the law makers, sold out by the men who put the law into force, the California miner has left the promise of justice from the law definers.

A protest intended to be "specific" enough to satisfy all quibbles in Washington has been filed at the Sacramento land office this week against the granting of a railroad patent to land notoriously mineral in character. In this tract, alleged to be "agricultural" by the railroad applicants, are fifty-two hydraulic and placer mines, some now in operation, many of them well-known gold producers, and some already patented under the mining laws. Included in the railroad company's application are sections 23, 27 and 33, fractional parts of section 31, township 14 N., range 13 E., Mount Diablo meridian, containing 2565.60 acres; section 9, township 13 N., R. 13 E., M. D. M.; north half section 3, lots 1 and 2 northeast quarter south half of northeast quarter, lots 3 and 4 northwest quarter, southeast quarter of northwest quarter, northeast quarter of southwest quarter, south half of southwest quarter and southeast quarter of section 5; north half section 7, sections 9, 15 and 17, township 13 N., R. 12 E., M. D. M., containing 3441.42 acres, and section 13, township 13 N., R. 11 E. Among the mines therein located are the New York placer, the Emerald placer, the Wieland, the Georgia, Arizona, Garnet, Wyoming and Utah placer mines, the patented Clysdale mine, the Poland and Ramsey, the Oregon, Colorado, Amethyst, Montezuma placer mine, Mikado placer, Deadem placer, Caliope, Summit, Diana and Bunker Hill; Hillside, Sunnyside, Treasure, Eclipse, Delaware, Sapphire, California, Nevada, Idaho, Texas, Agate, Opal, Ruby, Turquoise, Topaz, Corcoran and others.

All these, the railroad company claims, are "agricultural land," not in ignorance, but defiance of the law and the facts, the defiance being aided by the previous and present efforts of the Land Commissioner to twist and turn his own rules so as to give the miner no chance and the corporation every opportunity. Accompanying this protest are photographs showing the mines, men at work thereon and other visual proof of the truth of the protest and the assertion that the ground is mineral. If that is not mineral ground, then there is no mineral ground in this State or any State in the Union. The ground specified has been worked for 30 years, and hundreds of thousands of dollars have been extracted therefrom. Never in all the history of corporate greed and disregard of facts, statutes or justice has there been a more flagrant infringement on right or a more brazen effort to acquire what the law specifically exempts.

The railroad newspapers are still in full cry and stop at no misrepresentation or falsehood. Their columns teem with misrepresentation, and hundreds of copies go daily to the land department at Washington. All sorts of influence are brought to bear, and all manner of unjust motives ascribed to those who work for the public right and the miners' just claims. The issue is clearly defined and must be fought to a finish. It is the duty of every miner in the State to aid in forcing it to a successful termination. Enough has been said and done to show that the Washington authorities are fully aware of the illegality of the railroad effort, and cannot plead ignorance of the facts. That they continue to use their almost omnipotent influence on the side of the railroad is presumptive evidence of complicity therein. But if beaten in the executive branch of the Government, the miners have still left the court of final resort, and to this the matter will eventually come.

AT the time the proposed constitutional amendments were adopted by the voters of this State last November the statement was made that the "alien amendment" prevented foreigners from owning or holding real estate. In response to individual inquiries received by this paper from Englishmen resident in London, who contemplated buying California mining property, the matter was given considerable study and the statement finally made in these columns that the adoption of the amendment did not militate against such acquisition, and that no obstacle had been created to prevent aliens from holding mining ground in this State. Since then the question has been referred to the State Attorney-General, who officially states that "the only effect of Article I, Section 17, of the Constitution, as amended in 1894, is to 'prohibit the Legislature from depriving resident foreigners of any of the rights enjoyed by native-born citizens with respect to acquisition, possession, enjoyment, transmission of inheritance of property,' other than real, or of the ownership of real property owned by them when the amendment was adopted; that the resident alien is secured by the Constitution in these particular privileges, but he may be secured by the Legislature in as many more as it chooses to give; that 'there is no provision of the Constitution which prohibits the Legislature from conferring the same (or other) rights upon' non-resident aliens, or extending the privileges of resident aliens; and that, therefore, the amendment does not affect prior legislative enactments conferriug property rights upon resident and non-resident aliens, nor does it deprive the Legislature of the power to add to the privileges secured by the Constitution to resident aliens in any manner that it may see fit. In other words, the rights heretofore conferred by the Legislature upon all aliens, resident and non-resident, remain in full force until repealed or abridged; and the only re-

striction placed upon future legislation on this subject is that no law can be enacted which will abridge the constitutional rights of resident aliens in property other than real estate, or in real property owned by them when the amendment was adopted," which would seem to be sufficiently conclusive and satisfactory.

On April 6th this paper notified its Montana readers that in that State, after July 1st, the Montana "prospector must sink a hole at least ten feet deep in solid formation, must have at least one defined wall, and must stake his ground so that the stakes can be found. The notice of location must be placed conspicuously at the discovery shaft, where it can be seen—not on the stump of a tree in the neighborhood. He is allowed ninety days in which to do this work. If he relocates an old prospect hole he is required to sink it ten feet deeper than when he first found it, and takes and records it the same as though it was an original discovery. If he runs a tunnel it must be at least ten feet long, so as to determine the fact that a vein supposed to carry the precious metals has been discovered." A Butte mining paper, recently started, copied the item, along with a good many others, forgetting to give credit, and after awhile a Deadwood, S. D., paper copied it from the Butte paper, leaving out the word "Montana." Then a city contemporary published it verbatim as it appeared in the Deadwood paper, and several interior journals have copied it, with the result that every mail brings inquiries. Usually the clipping is sent with the words, "How is this?" or similar legend appended. The matter is mentioned merely to say that the facts are as published in the PRESS of April 6th. The requirements specified apply only to the State of Montana.

Concentrates.

THE Cœur d'Alenes are turning out 1000 tons of ore per day.

DENVER papers say that there will be no postponement of the Mining Exposition. It will open, according to announcement, in July, 1896.

THE Blaine Mining Company will build a smelter at Leavenworth, Or., with 100 tons daily capacity, to be in operation inside of twelve months.

THE *Enterprise* says the Dayton dredge is now at work pretty close to the Douglass mill, and is scooping out considerable amalgam as well as high-grade sulphurets.

THE Great Northern Gold Mining Company has incorporated at Spokane, Wash.; capital stock $500,000. The High Ore Gold Mining & Smeltiug Company has also incorporated there; capital stock $500,000.

THE Oroville *Register* in speaking of several mines in Butte county, names the Old Pioneer, at Grass Flat, which, it asserts, "has fifty men at work, and which is taking out $80,000 per week." Some of the figures seem to need revision.

THE sulphuric acid used by the De Lamar Company, Ferguson district, Nevada, is shipped to Milford, Utah, in large tanks, each holding 65,000 gallons. It is then pumped into smaller tanks and shipped by wagons 160 miles across the desert.

THE Union and Companion mines in Cornucopia district, Oregon, were sold in Baker City this week to W. J. Clark, of Butte, Mont., and John E. Searles, the manager of the sugar trust, for $45,000—$20,000 for the Union and $25,000 for the Companion.

ALL the buildings except the hoarding-house at the Butte King mine, twenty miles from Powelton, Butte Co., were burned last week. The mine is owned in this city, and active operations were to have heen hegun this week. The buildings will be rehuilt.

IN the North Fork mines, Plumas Co., J. P. Welch is running a tunnel in the Glazer mine. Col. Day has about closed a deal for the Sunnyside with an Eastern company. F. Scott is making the King mine pay, and considerable development work is being done.

THE Golden Fleece Mining Co., Lake City, Col., is reported to have been robbed by its employes and others of over $100,000 worth of high-grade gold ore. The management has shut the mine down and will spend considerahle money in investigating the wholesale thefts.

THE Hudson Bay Mining Company has incorporated at Grass Valley; directors—M. Ford, A. McDonald, A. Mullee, J. Southern, S. P. Adams, W. Provis Jr. and M. A. Murphy; capital stock $1,000,000, divided into 100,000 shares, of which 55,100 shares have heen subscribed.

THE Condor mill at Condor canyon, Lincoln Co., Nevada, was hurned last week. It was a fifteen-stamp mill, the property of J. Neshit & Brother, and it had heen shut down for a year. Nobody was living at or near the mill and the work is supposed to be the fire of an incendiary.

THE transfer of the twenty-five claims in the Silver Star, Esmeralda Co., Nevada, district to Senator Wolcott of Colorado took place at Carson during the week. The price paid was $600,000. Mr. Wolcott and his associates intend to spend considerable money in development.

AN alleged submarine gold find off San Clemente island, about 100 miles west of San Diego, Cal., forms a pleasant variation in sea-serpent and buried-treasure stories. The newspaper accounts say the gold won from the waves "is of fine quality and entirely free from quartz."

THE "rod man" is reported circulating in Colorado mining Camps. He has sublime faith in himself but is a fake, nevertheless. The man who buys his services and quits there only loses what he pays him, but every dollar he spends in developing the ground indicated is usually an additional loss to the believer.

NEXT Friday the Elizabeth Mining Company's properties in Granite county, Montana, comprising eight quartz claims adjoining the Bimetallic mine, will be sold at sheriff's sale to satisfy a judgment of $8000 in favor of the St. Louis Union Trust Company. The shut-down of the Bimetallic has caused the Elizabeth mine to fill with water.

E. W. WOODRUFF, paymaster for the Nacasari Copper Company, Sonara, Mexico, while traveling by buckboard to Nacasari from Bisbee, A. T., with money to pay the employes, was attacked by masked men near Cachuta, about forty miles south of the Arizona line last Thursday, Moreno the driver, was killed and $6,000 was taken by the brigands.

THE Merced *Star* says the old French mine in the mountains above Madera will soon be the scene of lively work again, as capitalists have control of it and are about to resume operations. The property has remained idle for several years, and a great deal of money bas been sunk in its development. It is claimed that the mine is a good property if properly handled.

THE Altoona Quicksilver Mining Company is reducing about twenty tons of ore per day and producing ninety flasks of quicksilver per week. The snow has entirely disappeared and they are able to sun-dry considerable of the ore which comes from the ledge in the form of thick mud, and which must be dried before it can be placed in the roasting pans and retorts.

DIRECTOR OF THE MINT R. E. PRESTON estimates the world's production of gold for 1894 to approximate 8,870,518 fine ounces, valued at $181,510,100, as against $158,836,000 for 1893, showing an increase during the year of $22,674,000. The greatest increase in the production of gold during the year were: Africa, $11,400,000; Australia, $6,073,000; United States, $2,500,000; Mexico, $3,195,000.

THE Eureka Consolidated mine on the Forest Hill divide, Placer Co., one of the most valuable mining properties in the State, is about to pass into the hands of Eastern people, if the price can be agreed upon. There are 275 acres, and nearly seven miles of ancient channel. Over $30,000,000 has been got out of the divide, and a good many think considerably more than $30,000,000 additional will be secured from the same locality.

THE Prospect Mill and Mining Company (Directors—C. A. McQuesten, A. E. Phelan, E. C. Barclay, V. Schmidt and M. M. Davis; capital stock $50,000, of which $40,020 has been subscribed), and the Piedmont Gold Mining Company (Directors—W. W. Stone, D. Holse, C. Geisler, W. Marxsen, H. Bruns; capital stock $1,000,000, of which $5000 has been subscribed), incorporated in San Francisco this week.

LIEUTENANT GILLETT says that the U. S. Debris Commissioners are determined that no hydraulic mine shall he operated unless the owners conform to every requirement of the law and orders of the Board. That is right and proper and will be endorsed and observed by every responsible hydraulic miner in the State. The miners agreed to uphold the law and are doing so. 'Tis the anti-debris people that are opposing its provisions and practical operation.

A NEW silver ore has been found in Felsobanya, Hungary. It occurs in short prismatic crystals, belonging to the orthorhombic system; luster metallic; color dark lead-gray or steel-gray to black. An analysis gave the following result: Sulphur 23.32 antimony 41.91, lead 22.07, silver 11.31, copper 0.69, iron (zinc, manganese) 0.70, insoluble 0.04,=100.04. The percentage composite required by the formula $AgPbSb_3S_6$ is as follows: Sulphur 22.14, antimony 41.52, lead 23.88, silver 12.46 =100. The name Andorite has been given to the mineral.

ACCORDING to a Butte county paper, the following is a verbatim copy of a mining location recently sent in at Oroville, and, as the fees were paid, it was duly recorded: "The undersigned clams this clame non as the Hurd Clame, the cabin stove and fictures for cooking also the water for mining purposes located on Alder Creek." Spelling is largely a matter of private judgment, but accuracy of description of the property claimed is necessary. There are rules and requirements for properly locating mining ground which should in all cases he exactly complied with to avoid vexation, contest and probable loss.

SUIT has been brought in Denver, Col., by T. D. Kelley, asking for a receiver for the Little Johnny mine, and that he he awarded a one-sixth interest in the Leadville Bonanza mine. He asserts conspiracy and fraud were used to get his rightful interest in those mines away from him and others he represents and that $1000 was all he got for such interest. Incidentally, the statement is given great prominence that the property is worth "from $50,000,000 to $100,000,000," that "it is a wonderful bonanza, paying millions of dollars profit," etc., all of which doubtless has a commercial value to all parties interested.

THE hig Anaconda Mining Co. reincorporates to-day, uuder the name of the Anaconda Copper Co., with a capital stock raised from $12,500,000 to $30,000,000. It is understood that the great concern is increasing its capital stock with the purpose of placing some of it on the market to raise money for development work on its new properties, and for the erection of a big refinery. The formal reorganization takes place to-day, and the company's vast properties in Montana will be transferred to the new company, including its Anaconda townsite, hotel properties, stock ranch, railroads, street railways, mines, smelters, reduction works, saw and planing mills, waterways, reservoirs, canals, electric light plants, telephone and telegraph lines, etc. The company is at present enlarging its smelters and erecting hig sampling works in Butte.

IN last week's issue of the PRESS was puhlished the full text of the bill prepared by the legislative committee of the State Miners' Association for passage by Congress. Another hill has been prepared which will also be submitted to our California representatives in hoth houses for their approval and promised support. It makes provision for appropriatiou of $1,030,000 to be expended under the direction of the Secretary of War, in accordance with the plans and specifications of the Debris Commission, for the construction of works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in this State. This matter was fully discussed and affirmatively treated at the convention last November, and the action of the legislative committee in this regard is in accordance with the resolutions then adopted.

F. W. BRADLEY, manager of the Bunker Hill and Sullivan mines at Wardner, Idaho, says he will reopen those mines on the terms proposed by the citizens and business men of that place; he will pay $2.50 and $3 a day, and whenever silver and lead advance in price wages will be advanced; will employ union men, but will not recognize the union as an association. He says his intent is to do considerable development work and permanently operate the mines; will hire men who live in Wardner in preference to outsiders. If he can do this he will go ahead; if not, the mines will be shut down finally.

THE O. K. Gold Mining Company has incorporated in Spokane, Wash.; capital stock, $1,000,000. The company is established permanently at Spokane. Trustees are named to serve until the first Wednesday in December next: I. Y. Cole, D. J. Hughes, C. P. Ondin, J. E. McCall and J. W. Kiley, all of Spokane. The purpose is to own and operate mineral properties in the United States and British Columbia; to maintain mills, smelters, concentrators and reduction works; to operate ferries, railroads and other means of transportation, together with tramways and all the facilities for carrying on the business of mining.

THE Ibex, Utah, Mining and Smelting Company, of which F. L. Underwood is president, has gone to pieces. A year ago this syndicate took a hond on the Ibex mine in Detroit district for $135,000, and then expended $80,000 on a smelter. After paying $15,000 on the mine and putting the smelter in operation the company encountered financial difficulties and the smelter was attached. A receiver has been appointed while the mine has reverted to the original owners. It is a good property and it is alleged that the Underwood people extracted $300,000 worth of ore while it was in their hands. Extravagance and mismanagement are said to have been the causes of the company's failure.

THE following are recent Colorado incorporations: Crooke Reduction Company; capital stock, $100,000; a New Jersey corporation; office, Colorado Springs. Colorado M. and M. Co., to operate in Arapahoe and Boulder counties; capital stock, $500,000. O. H. P. B. M. and M. Co.; office at Pueblo; will operate in El Paso county; capital stock, $600,000. Bouanza Cripple Creek G. M. Co.; capital stock, $500,000; will operate in El Paso county, with headquarters in New York City. Nellie Bly G. M. and Reduction Co.; capital stock, $100,000, Boulder county. Copper Queen Leasing and Mining Co., Colorado Springs; will operate in Park, El Paso and Jefferson counties; capital stock, $100,000. Nashville Leasing Co.; capital stock, $500,000; to operate in Gilpiu county.

—The long-delayed suit of the U. S. vs. the North Bloomfield Gravel Mining Co. was begun in the U. S. Circuit Court in this city this week. The question at issue is not an allegation of damage to any navigable stream or its tributary, occasioned hy the working of the mine. The suit of the Government is to compel the company to comply with the Caminetti law, it being the only considerable hydraulic mining corporation that has refused or neglected so to do, and the result of the suit involves the validity of the Caminetti act and the constitutionality of the Debris Commission. The matter has been exhaustively discussed out of court, and whichever way the decision goes it will be carried finally to the highest tribunal in the country.

P. A. O'FARRELL writes from Rossland, B. C., confirming what was recently said in this column about the Trail Creek mines, and which was assailed as being "incorrect and unjust." He says: "Labor will have steady and continuous work in these mountains for generations to come, hut money is needed to pay that labor, and capital must receive the big reward from these mines. Great veins of ore are everywhere, but the rich-paying ore bodies are necessarily scattered, and the successful mine operator is the man who knows where to find these rich ore bodies. Moreover, the growth of Rossland and the largest development of these mines will depend on the building of smelting plants right at the mines. It costs $8 or $10 a ton to haul the ores to the smelter in Montana or at Tacoma, and consequently only ore worth at least $20 a ton can be profitably mined. The moment, however, reduction works are built here, $12 ores can be worked at a profit." Just so.

THE following is from the latest issue to hand of the London, England, *City Leader*, which at least shows kiudly intention: "It would seem that Californiia mining industry is to have a new lease of life. A well-known San Francisco lawyer is just now in Washiugton with the idea of bringing about a settlement with reference to the railroad land grants which covers mineral territory. He represents the State Miners' Association of California, which announces its willingness to secure lands for the railroad in lieu of those which it might lose on account of their mineral character. There are, we understand, persistent inquiries from England for California gold mines, and there are at least two contemplated sales, each of which involves $2,000,000. According to the same Association, California is being overrun by people searching for properties, and it is the belief of capitalists that California is one of the greatest gold fields in the world. It would seem, therefore, that when the Kaffir boom, the West Australian boom, and other like booms that are in contemplation are over, we may look for another California boom."

DISSATISFIED shareholders in the Bodie Mining Co., acted last Monday at the annual election. Their alleged grievance was that during last May there was shipped to the mill for reduction 525 tons of gold ore from which the pulp assays, less the value of the tailings, showed a valuation of $17,989.21. The bullion returns from that were $23,351.09, showing a gain of $5,361.88. The average value of the ore returned in bullion was $44.47 per ton, and the average loss in tailings 16¼ per cent. The amount recovered from the final clean-up was 23 per cent of the net bullion yield. The loss in the tailings was 16¼ per cent against 8¼ per cent and 4¼ per cent on two former runs. The value per ounce of the bullion from this run was but $4.90 28-100 against $9.34 2-100 per ounce last June, $11.42 89-100 per ounce last September, though the ore crushed last was taken from the same workings as that crushed in the proceeding June and September. The result of the election was that the opposition was beaten, but was conceded three of the seven directors. The annual financial report showed that the total receipts from all sources were $141,498.60. The bullion reduced yielded $122,469.34 and three dividends, amounting it all to $66,660, were paid. The mine expenses account for the year was $24,576.64. The New York agency of the company was abolished.

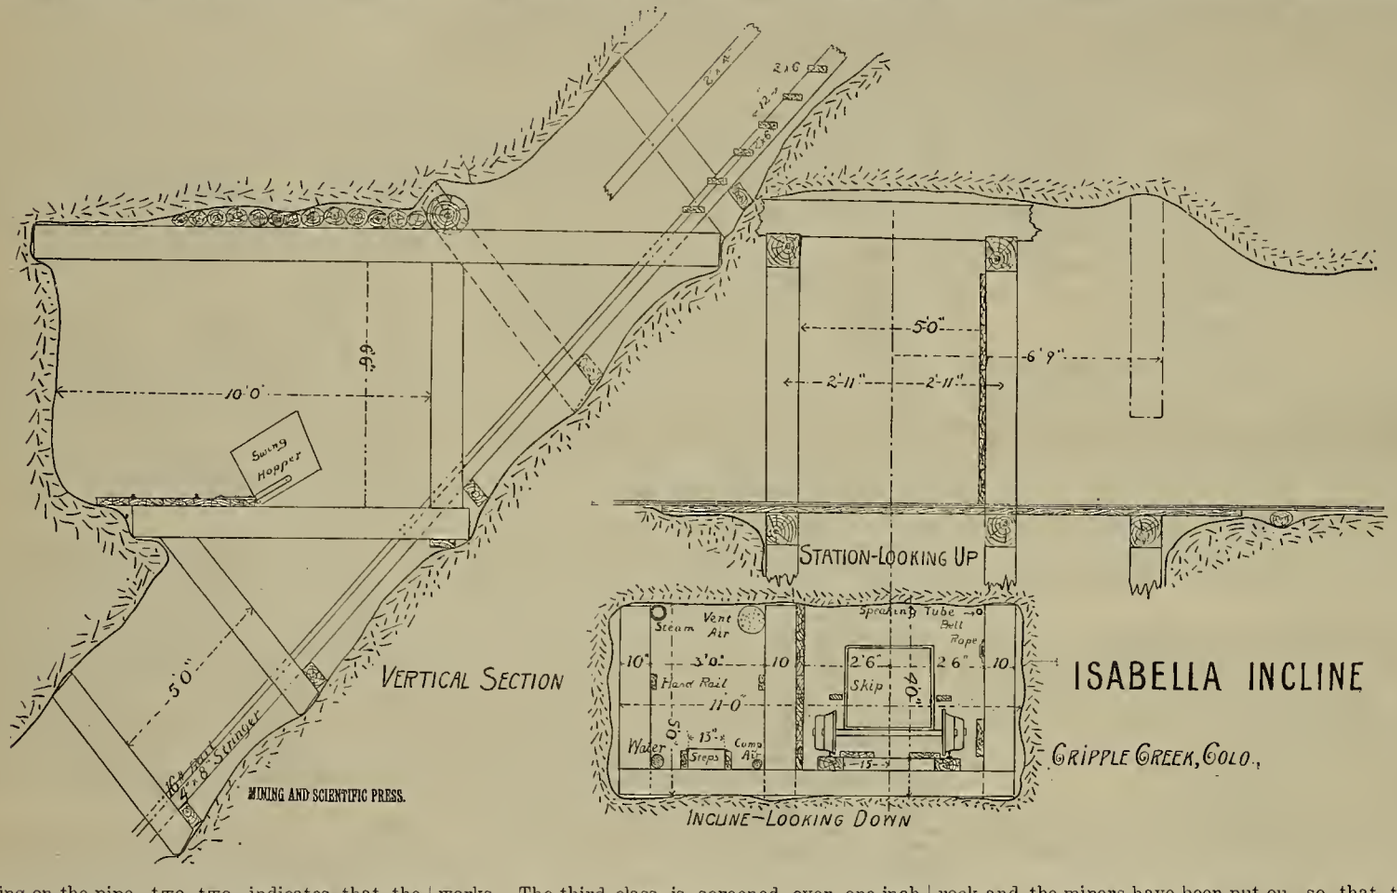
Timbering in the Isabella Incline.

Written for the MINING AND SCIENTIFIC PRESS by FRANCIS T. FREELAND, Aspen, Col.

The accompanying drawing shows a convenient and economical method of timbering an inclined skip-shaft and station, together with the dimensions used, designed for the Isabella Gold Mining Company, Cripple Creek, Col.

The shaft follows the vein, and, as the walls are good and the vein hard, stulls and not sets are used. The automatic dumping skip holds twenty cubic feet, although the mine cars hold but fifteen, in order to prevent any spilling when loading. The sixteen-pound rails are laid on four by eight-inch stringers on four by eight-inch cross-sills, with guide-planks and side-planks. This renders derailment and wedging infrequent. For hoisting water the skip has two flap-valves in the end, which are replaced by a dead-plate to prevent injury when hoisting rock. The skip is tagged to indicate the kind of rock and dumps into cars at the surface.

The quarter-inch wire bell rope runs in side pulleys. The 1½-inch iron pipe speaking tube is used to prevent the skip being rung away when in use, thus:



Pounding on the pipe, two, two, indicates that the skip is wanted and about to be moved, and an answer, one, means that it is in use. Conversation can also be carried on. Steps for this grade are much better than ladders. They have a six-inch tread, twelve inches on the slope, and two hand rails.

The ventilation for dead ends is forced by a No. 3 Sturtevant monogram blower, driven by a small engine. The main shaft pipe is No. 24 galvanized iron, eight inches in diameter, with telescope joints, secured by hook lugs and wire. At each level is a cross, with six-inch No. 27 pipe in the levels and four-inch in raises or stopes. The greater part of the mine is ventilated by an air shaft and winzes at either end, the natural current being controlled by airtight doors where necessary.

At the station the track of the level simply bows out over the shaft and the mine cars dump directly into the skip through a swinging hopper. The main station cap and lagging overhang the long spreaders. The timbers are round and hewed next the shaft and floor.

A word as to the character of the ore deposit and the method of mining will show the reasons for this design. The vein is a fissure in andesite and andesitic breccia, traversed by diorite and phonolite dykes. Its width is from a few inches to a few feet, and it assays from one-half to thirty ounces gold per ton. The ore is mostly quartz carrying free gold and tellurides in depth.

It is worked by overhead stoping. The mill holes are three feet wide and twenty-five feet apart and provided with flat chutes five feet nine inches above the track. The main line of stulls are set eleven feet above the track. The mill holes are cribbed or stulled and lagged, and the stopes filled with waste or stulled, according to the width of the vein and the waste available. The ore is broken on canvas protected by old plank.

Very few face samples are taken, as they are often misleading. Large grab samples are taken from the heaps in the chutes at night. Early in the morning they are run through a small power crusher, and cut down and sent to the assay office, the results being known at noon. As a mine of this sort makes but little dirt, one hoisting shift is sufficient except when sinking, although the stopes are worked two shifts by day's pay and the levels three shifts by contract. The drilling is mostly single-handed.

In the morning, water, waste or known kinds of rock are hoisted. At noon each trammer is furnished with a memorandum showing the number of the mill-hole and the proper skip tag. Over two ounces is first class; one to two ounces, second class; one-half to one ounce, third class; one-quarter to one-half ounce, fourth class; and less than one-quarter ounce, waste. The first-class is screened over three-quarter-inch grizzlies, carefully hand-sorted on tables and shipped as fine and coarse to the lead smelters. The second class is screened over seven-eighths-inch grizzlies and sold to chlorination works. The third class is screened over one-inch grizzlies and sent to a custom stamp mill. The fourth class is screened, without sorting, over 1½-inch grizzlies. The fines make good stamp-mill ore, and the coarse goes direct to a waste dump, as sufficient available fall allows this without handling. It is evident that with this method of classification, pockets at the stations and head of the incline would be of little advantage.

In sinking for a new level the order of operations is this: The shaft is carried down by a temporary track without timbering for 100 feet. At seventy-five feet the new levels are sent away for fifteen feet from a temporary plat. The station is started and the floor sills set and rough-lagged. The temporary track is taken up. The shaft is trimmed, if necessary, to secure a uniform grade from level to level. The shaft stulls are set and the station finished. The permanent track is put on. And, finally, the lining and manway completed. The drifting and sinking can then be resumed without danger to the station.

THE *American Machinist* notes that Troy, N. Y., is no longer the chief center of production of stoves and steam engines in this country. But while it was once a city of male workers only, it has now so great a collar-and-cuff industry that the balance of occupations for the sexes has been reversed. Our contemporary adds: "We have an impression, at this writing, that Pittsburg, Cleveland and some other manufacturing cities are suitable places for establishing more of the female industries, while the balance in New York City would be promoted by a reversal of the process.

The Calumet & Hecla.

TO THE EDITOR:—With the exception of the Calumet & Hecla Company, the practice of the officials of the several mining companies of withholding from the newspapers the publication of their monthly outputs of mineral copper seems to be for the purpose of permitting the directors and their inside associates to either "bull or bear" the stock market, and, as a well posted newspaper man remarked, "those officials are now making more money in stock gambling than in the legitimate pursuit of their duties which they owe to the shareholders and the public."

In the case of the Quincy, the product being 135 tons less last month was simply due to the fact that the No. 2 shaft house and shaft was in course of reconstruction and could not be used for the hoisting of copper rock. It was the intention to add another week's product to the monthly product and not report a short one, but they changed their minds in consideration that the short product would "bear" the stock and there would be a chance to buy in.

The wire ropes are now all on the new drums at No. 3 shaft Tamarack, and the cages for hoisting rock and the miners have been put on, so that the shaft is now ready to go into active operations next week. The addition of the product from this new shaft will greatly increase the product and will furnish copper from a deeper portion of the earth than has ever been mined. A. F. ISLER.

Houghton, Mich., June 17, '95

DEVELOPMENT of water power has been begun at Minneapolis, Minn. This latest utilization of the powers of nature is to be brought about by the construction of a dam below the falls of St. Anthony, which will husband the energy of the current now running to waste in the rapids. It is calculated that 10,000 horse-power will be added to the industries by the erection of this dam. A canal of sufficient depth to admit of steamboat traffic to the foot of the falls is also included in the improvements. About $1,000,000 is to be expended on the work, which is being carried on by the Pillsbury-Washburn-English syndicate, and the people of Minneapolis and vicinity are congratulating themselves on the facilities which these improvements will afford to the trade and commerce of that section.

AN English publication, *The Iron and Coal Trades Review*, is authority for this statement: "Wagon frames are made in Leeds and Chicago by the same system. In the latter city the workmen get twice the wages paid to their English brethren, and yet such are the facilities for turning out work possessed by the Americans and such is the energy which they display that it is possible to put the Chicago wagon frames on the market cheaper than those made in Leeds."

The Mineral Hydrocarbons.

NUMBER XXIX.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894, by Henry G. Hanks, F. G. S.

Merced County.—By newspaper accounts, Merced county was at one time credited with a gas well 650 feet deep. "A large drum serves to collect the gas, which is the only source of light and fuel used on the premises. The daily use of the gas is one of the most attractive features of the colony. * * * The well is near the Crocker & Huffman canal."

Monterey County.—The following are newspaper clippings, September 25, 1889: "While sinking an artesian well at Salinas, on a lot near the courthouse, a vein of natural gas was met with at a depth of eighty-four feet. On applying a lighted match, the flame arose to the height of ten feet. Gas veins have been struck here at different places years ago." * * * "The flow of uatural gas struck here last week shows no sign of abating, and the flame which, when first lighted, rose about six feet high, now rises sixteen feet. It is an immense sheet of flame from a width of eight inches at the mouth of the pipe. It increases to five feet at the top. It will be allowed to burn for some days yet, and then, if it should show no sign of exhaustion, measures will be at once taken to utilize it."

Orange County.—Natural gas occurs in the Santa Ana plains. Two wells have been sunk—one 347 and the other 740 feet deep. As described by Dr. Stephen Bowers, these wells much resemble those at Stockton. The section he gives is much the same. The temperature, the mineral character of the water which flows with the gas, and the physical properties of the gas itself show the conditions to be very similar. Dr. Bowers states that gas was struck near the same locality years ago. Gas escapes in other parts of the county, especially at Newport bay.

Sacramento County.—There is an artesiau well on the Haggin ranch, nine miles northeast of the city of Sacramento, which yields some inflammable gas. The well is said to be 2250 feet deep. In 1889 or 1890 the Sacramento Natural Gas and Water Company was organized to sink for water and gas. With what success I have no certain knowledge, but it would seem that the chances of finding gas in considerable quantity would be as favorable as at Stockton.

San Joaquin County.—At Stockton natural gas has been more exteusively produced and used than at any other locality in the State of California. The gas interest in that city has become a matter of very considerable importance, although the product is small as compared with that of the Eastern States.

The numerous gas wells of Stockton resemble each other so nearly that one is a type of all the others. The manner of sinking the wells, construction of gasometers and connections are much the same iu all; they are simply artesian wells, the overflowing mineral water of which is supersaturated with hydrocarbon gas.

As the water flows over the rim of the exit pipe it has the appearance of being milky. If a glass goblet is filled with it, a clear stratum soon appears near the bottom, which increases until withiu a few moments the apparent turbidity wholly disappears, leaving the glass full of transparent aud colorless water. This whiteness, like that of snow, is due to the presence of minute globules, the former being gas, the latter atmospheric air. Milk under the microscope is seen to be a transparent fluid containing equally transparent fat globules. The effect produced by light is in either case the same; they seem to be white and nearly opaque. At the Jackson well a portion of the gas escapes through a small basin that surrouuds the pipe which termiuates three or four feet above. The contents of the basin are clear, but if they are stirred violently, or if a stone be thrown into the placid water, gas rises for a time, giving the water the same characteristic appearance it presents when flowing from the end of the pipe.

The water and gas, having no affinity, part company as soon as they emerge, not because of any mutual repulsion but by reason of their different specific gravities. The water, by gravity, seeks the earth and a passage toward the center, while the gas, by a different impulse, soars away far above the clouds.

If, after the excess of gas has escaped, some of the water be violently shaken in a bottle, the mouth of which is closed by the hand, a gentle puff of gas results, but with no explosive pressure, as would be the case if some of the carbonated waters of the State were similarly treated; but if the water is allowed to remain uncovered for a few hours no uncombined gas can be discovered by the usual tests employed by chemists.

The water from open wells overflows with great regularity. The gas escapes with a subdued hissing or boiling sound which can be heard at a distance of several feet, but when it escapes under the gasometer the sound assumes a different character, humming like distant machinery in motion.

At the Jackson well I was deceived by a sound which seemed to indicate the escape of the gas in pulsations. In addition to the usual murmur, at the end of nine seconds with great regularity, there was a louder rumble which interested me, for I was aware that the gas and oil in Pennsylvania flows in pulsations; but I found on closer inspection that the sound was due to the intermittent escape of surplus gas under the lower rim of the gasometer, all of which was going to waste, and this, I was informed, amounted to 10,000 cubic feet in 24 hours. Pressure boxes—if I may so call them—are built over each well; they are shallow and not large; the basin which holds the water is circular, and is built of brick laid in and covered with cement; they are from 4 to 8 or 10 feet deep and about 16 feet in diameter. Within this space is the gasometer, which acts as a pressure box and causes the accumulated gas to flow to a more capacious storage gasometer of thick sheet iron galvanized or painted, sometimes both. The tops of these primary iron chambers are flat; an opened yeast powder can turned edge downward in a basin of water would represent one on a small scale. There is no opening on the top, on which half barrels filled with earth or bags of sand are laid. The open end of the well pipe rises in the center of the chamber nearly to the roof; the overflowing water escapes at an opening constructed on the principle of a trap. The water level being thus maintained, the rising gas is soon under pressure and the iron chamber rises in proportion. The weights increase the pressure, which can be regulated by multiplying or diminishing them. An exit pipe also rises from the bottom of the basin, the end being within the chamber and above the surface of the water; if this pipe is open the gas will flow through it under slight pressure to any point required, and is first generally collected in the large storage gasometers mentioned. A five-inch iron pipe had been laid to the city from the Jackson well, but at the time of my visit it was not in use. If the exit pipe is closed, the pressure, increased by the rising gas, soon causes it to escape under the edge of the iron chamber, as in the case mentioned at the Jackson well, for the flow of gas never ceases. All the storage arrangements are constructed on this principle. The large storage and distributing reservoirs or gasometers are built in the following temporary manner:

A circular pit is dug in the earth from 35 to 40 feet deep and the same diameter; a pump is rigged to keep out the water, and is worked by a steam engine, the fuel being gas from a pressure-box near by. The bottom of the pit is leveled and a great redwood tank is built, with tight bottom and sides; the staves are bound together by strong hoops of iron tightened by set screws; the pipes of ingress and egress are brought up through the wooden bottoms and made tight by well-packed flanges; workmen then put together sheets of iron punched for rivets. When these are joined a great hoop of sheet iron forms the lower edge of the gasometer; another and another are added until the chamber is fully constructed. Earth is then filled in aud leveled about the outside of the tank, and a finished gasometer is the result, which is then filled with water and the pipes joined by flanges with the main and with the pipe of the pressure-box, through which the gas flows until the large chamber is full. In some cases more than one of these gasometers are required to take care of all the gas produced by a single well.

The gas at Stockton does not seem to differ from that of the burning spring in Colusa county; it is colorless, transparent, without odor, and burns with a fervid, almost non-luminous, flame; this latter property is a serious defect, which detracts from value of the gas. An attempt has been made to remedy this fault by passing the gas through an atmosphere of naphtha, gasoline, or other light petroleum, but it was neither economical nor effective and was soon abandoned. Special burners are now used; the favorite seems to be the Welsbach incandescent. The Lungren regenerative gas lamp is sometimes used, and is fairly satisfactory. For domestic use the gas seems to give perfect satisfaction, and for that purpose it will, in my opinion, be very largely used in Stockton and elsewhere in the State if the supply continues, which we have good reason to hope and believe it will. For large manufacturing operations it is not so well suited, not, however, for any reason except the comparatively small yield of the wells and deficiency of pressure. Unless the true bedrock should be reached, or different conditions met with, this cannot be expected. I have heard of no instance in which gas was used in a large way that the heat was not assisted by the addition of coal or other fuel. This opinion should not be construed to the discredit of Stockton gas, or the gas wells. If Nature does not supply this convenient fuel in the enormous quantity that she does in Pennsylvania and some other States, it is still in sufficient abundance to be of much practical value. It is a great blessing and should be used to its full capacity for power and heating. The gas was sold at the time of my visit at the rate of one dollar per thousand feet, and at less for quantities. Supplied to small gas engines it is a cheap and very convenient source of power, and affords great facility to small manufacturers. Pure unalloyed blessings are the exception and not the rule. If we cannot equal Eastern gas production, we should at least be thankful for what we have.

(*To be continued.*)

Treatment of the Pyrites Without Roasting.

The St. John d'El Rey mine, in Brazil, paid dividends for nearly one-half a century. The lode matter contained about fifty per cent of pyritic matter, a mixture of magnetic, arsenical and common iron pyrites. They stamped between one and two hundred tons per day. It was reduced to a very fine condition; about ninety per cent passed through a sieve of 10,000 holes to the square inch. The concentration was doue on bullock skins and baize cloth. The gold in the washings from the skins and baize cloth was amalgamated in wooden barrels. The lode matter contained from $6 to $22 per ton, averaging about $11. The loss of gold in concentration was from ten to fifteen per cent, and in the barrel amalgamation from five to ten per cent, according to the richness of the ore.

The tailings were exposed to the action of air and moisture for a long time, whereby a portion of the mineral became oxidized, liberating the gold previously enclosed by the sulphides, which was then treated in the arrastra.

KRUSHITE is the name of a material by which extraordinary results are, it is said, being obtained by stoue workers, is sawing and polishing granite, stone and marble. It consists of minute chilled east metal shot varying in size from mere powder to clover seed size. Blocks of granite are now being sawn with this instead of sand, at the rate of four inches in depth, and hard grit stone at nine in depth an hour, with twelve blades iu the machine. It is superseding diamond saws, aud is claimed to be capable of doing the same amonut of work at one-tenth the cost. It is also being used in sand blast apparatus in place of sand, and in substitution of diamond drills for boring and drilling. It is an interesting fact that in sawing and polishing, one ton of this material is equal to about 300 tons of the sharpest sand. The tiny balls are chilled to intense hardness without being brittle and by striking it on an anvil the latter will be indented. The action of Krushite is to roll between the blocks and the saw blade or "rubber," doing its work by crushing as a wheel glass-cutter does. Consequently it retains its spherical-shape, and cutting or crushing power, and, as it does not indent or become partially embedded in the blade or rubber, as in the case with sand, emery or corrundum it is rolled backwards or forwards, smoothing the surface by crushing the projecting parts of the blocks being sawn or rubbed. The wear aud tear on the blade or rubber is reduced very much, aud it is said the labor and driving power are reduced one-half. It is used exactly in the same way as sand, and no alteration to existing machiuery is necessary.

THE ballasting upon the Southern Pacific roadbed, between San Antonio and El Paso, is laid by hand with cheap Mexican labor in a very artistic manner. The material is broken rocks from the cliffs that inclose the track at intervals nearly all the way, and the edges on both sides, mile after mile, for hundreds of miles, are marked with selected stones, all of a size and placed as regularly as the bricks in a building. They are mostly light gray sandstone, and the track hands have been particular in laying them. When the border stones are laid down properly the ballast can be dumped from the cars as rapidly as need be, but it is always raked off afterward with the greatest care, so that its surface shall be regular and even. This sort of decoration probably would not be encouraged by railway managers where track hands are paid $2 and $2.50 a day, but the "greaser" works for 75 cents and is satisfied.

THE greatest labor union in the world, the British Amalgamated Society of Engineers, reported a membership of 75,510 last year, and an income of $1,306,965. Of this amount, $688,934 was given to members out of work, $201,247 was paid in sick benefits, and the amount devoted to funerals was $54,061. For other benevolent objects the sum of $28,704 was expended, while the item of dispute benefit shows an expenditure of $9,253. The last item shows what was expended on strikes during the year. The average number of unemployed during each month in the year was close upon 7,000 members, all of whom were supported from the funds; the average for the year was equal to 8.4 per cent of the members.

DID you ever stop to think why oil barrels are painted blue? In making the barrels they are thoroughly soaked in water, then they are painted blue, as this is the best pigment which will hold the oil. Then when the cask is full there is oil on the inside and on the outside, with water between them, and the oil won't come through.

THE Naval experts at Washington are discussing the propositiou to place the armor of the new warships higher up than formerly.

THE California State naval reserve has been awarded $3845 out of the Congressional appropriation of $25,000.

Buying and Selling Mines.

TO THE EDITOR:—I observed in the papers last week, as an item of general news and interest to California, that an association of capitalists in New York were about to organize a syndicate for the purpose of disposing of mines in this State, and presumably elsewhere, the idea being, I suppose, that the respectable character of the gentlemen associated would inspire confidence of capitalists in the East and abroad and lead to the disposal of such properties as the association after due investigation can endorse, all of which is theoretically very attractive and reads beautifully. But capitalists cannot understand why the gentlemen of such an association, and of such well-known wealth and shrewdness, do not take some of these attractive things they offer to individual account, the promised returns being as good or better investments for their capital than could he found elsewhere.

I know that will he the first question asked by capitalists. Having made the attempt to carry out this same enterprise some five years ago in New York I was met with the question, "Why do your capitalists let such tempting investments go abroad; they have the money and the experience in mining business?" It was useless to try to explain that there was a limit to their capital and that it was, as a general thing, already invested to the extent of their means. But this would not do. They were too suspicious, and although there were good names and good men at the hack of the enterprise it did not succeed.

What is wanted is a syndicate of capitalists to *buy* mines, not sell. There is more money to he made by that method than in the commissions in selling, aud the plan is simple. Let an association of capitalists he formed on the joint-stock principle, with a capital say of half a million as a beginning, to be called up as may he required.

At the outset iuvite all who have good properties to dispose of to send in plain statements of their mines (not reports), giving location, character of ores and value, as far as can be ascertained, and nature of improvements. When any such description or statement seems sufficiently attractive to justify, the associatiou to send their own experts to give the property a faithful examination and report to the head office. If the property gave evidence of future value, the association to enter into contract with the owner to this effect: The association to put men at work to make further development to an extent warranted by the prospect, and, if ore is found to justify a mill, to erect same—five, ten or twenty stamps, as justified by the result of exploration—and the ore worked under the supervision of the association agent, the proceeds, less expenses, to go to recoup the association for its outlay; thereafter an equal division of profits and property, or the association may purchase the owner's interest at a price agreed upon.

There are hundreds of claims all over the State that show as much promise as did the largest and hest mines we have. They were all mere "prospects" originally, and would have so remained to this day had not their owuers heen fortunate enough to be able to develop them.

There may he failures, and the money speut in development in many instances bring no returns, but then, again, there may he one success that will more than cover the cost of many failures. If one out of five so prove a success it will pay for the failure of the other four, with the prospect of big profit besides.

There are, as I say, hundreds of good prospects owned by men too poor or too lazy to work and develop them (the latter a prevailing cause). Let the capitalist step in and do it, and we shall soon see our gold product doubled.

This is the scheme for this new association to take up, and where there is more money than in a dozen enterprises of the sort uamed. Everybody can *sell* mines, as it requires no capital to do so; but it is the buyers we want and the men to help the miners develop their idle claims, and if it proves good the association will acquire properties cheaply that will enable them to organize mining companies and have such shares to sell as they can conscientiously offer to their friends. MINER.

June 17, 1895.

"IT HAS BEEN DISCOVERED," says the *National Druggist*, "that the famous tree, from the hark of which quinine is obtained, furnishes no quinine except in malarial regions. If a tree is planted in a malarial district, it will produce quinine; if it is planted in a non-malarial district, it will not produce quinine. It is therefore claimed that quinine is a malarial poison, drawn from the soil and stored up by this wonderful tree."

Books Received.

"*Alaska; Its History and Resources; Gold Fields, Routes and Scenery*," by M. W. Bruce, is carefully written, superbly illustrated, and gives considerable authentic information about the resources of the Territory, coupled with a little personal puffery. The ordinary newspaper article contains more of practical value to the miner or prospector than this book. An excellent map of the Territory is annexed. It is published and for sale by Lowman & Hanford, Seattle, Wash.; price, $1.25.

Coast Industrial Notes.

—San Francisco manufactures each year about $150,000,000 worth of goods.

—Over 900 men are now employed at the Mare Island Government navy yard.

—The Risdon Iron Works has put in two new boilers at the Western Sugar Refinery.

—Nevada has 620 persons engaged in manufacturing. Their annual product is $1,105,063.

—Fir, spruce and cedar logs at Grays Harbor, Wash., are quoted at $4.50 per thousand.

—Marysville has voted almost unanimously to issue $40,000 bouds for sewerage purposes.

—The Pacific Rolling Mills are making 4000 tons structural steel for the Parrott building.

—Washington has 20,366 factory hands and annually turns out $41,768,022 worth of products.

—Riverside, Cal., has decided to spend $90,000 for street improvements and electric lights.

—Oregon employs 18,978 hands in her factories and makes annually $41,432,174 worth of goods.

—Idaho has 774 persons engaged in the manufacturing business, the annual output being $1,396,096.

—It is thought that the owners of the Corral Hollow coal mines will build their railroad into Stockton.

—Napa, Cal., invites bids till July 15, '95, for a 50-years' franchise to build and run a street railway in that town.

—The State Labor Commissioner reports that Japanese are working in the country for 50 to 75 cents per day, exclusive of board.

—Leading local cigar manufacturers say that a tobacco crop can he raised in this State and sold to the cigar makers for 25 cents per pound.

—The Comox mine in British Columbia, the only coast rival of the Blue Canyon, is reported sold by the Southern Pacific to the Wellington Coal Company.

—The Southern Pacific Railroad Company will build a three-story depot, hotel, roundhouses, machine shops, coal bunker, etc., at Salinas, which will he the end of the division.

—Exports from San Francisco by sea in May were $2,245,000, against $1,435,600 for May, 1894. Those for the first five months of 1895 were $11,286,000, against $10,235,700 during the same period in 1894.

—The new Mutual Electric Light Co. has a new idea in the matter of redwood conduits for the wires. Francis Smith & Co. are making 300,000 feet of conduit of California redwood dipped in asphaltum.

—It is calculated that every 100 hicycles means a loss of revenue to the street railway companies of $60 a week. If so, in this city, where the hicycles number 10,000, the car companies lose $6000 per week.

—The city Furniture Workers' Union has ordered a strike in the factory of Fink & Schindler, which pays furniture workers $1.50 a day, having decided against permitting its members to work for such wages.

—The S. F. police commissioners have given the Golden Gate Wooleu Mills a contract at $5.50 per yard for sufficient cloth to make 100 police uniforms. The local mills have to thank the Manufacturers' and Producers' Association for this.

—On the 20th inst. ahout $200,000 worth of property belonging to the Seattle, Wash., Street Railway Company was burned. The company's power-house and twenty-five cars were destroyed, and the electric plant almost totally ruined.

—For the first time in its history the Fire Department Committee of this city this week awarded the contract for two years' supply of cotton fire hose to a local rubber company. The hose will be manufactured in this eity, and will be three inches inside diameter.

—J. A. Wilson of this city has leased the Merrimack mill property on the Carson river and put in an extensive plant of stone-cutting machinery to work a large quarry near the mill. It is expected that fifty men will be employed and that the cut stone will find ready sale.

—The Oriental Gas Engine Co. is building two 20 H. P. marine gas engines for the Piper-Aden-Goodall Co. as an auxiliary for the schooner Piute. They will operate twin screws. The company is also filling several orders for small launches and irrigating plants.

—Representatives of twenty-five firms of Tacoma, Portland, Seattle and Mount Vernon, which ship 80 per cent of the shingle output of the Pacific Northwest, met in Seattle last Wednesday and organized the Pacific Lumber and Shingle Association. A constitution and by-laws were adopted and officers elected.

—The Pelton Water Wheel Company have recently shipped a 200-H. P. plant for the South Yuba Canal Company, to operate an electric station at Newcastle. They also have on hand a 500-H. P. plant for the Concheno mine in Mexico, intended for running the mill, hoisting and pumping works of this company, as also an electric light plant for the mill and mine.

—A Nicaragua dispatch states that "the committee of engineers appointed by President Cleveland to examine the plans and route of the Nicaragua canal have been much pleased by what they have heard and seen of the condition of the canal work. The canal line has been cleared between the lake and the western terminus, and the work of clearing the route from Greytown to Ochoa is nearly completed."

—The Minnesota and Arizona Construction Company has organized in Maricopa Co., Arizona, with $50,000 capital, one-half of which has been subscribed. The general intent is to reclaim the Mojave desert. L. B. Palmer, Pasadena, Cal., is secretary. Another corporation—the Arizona Land Co.—has organized in Maricopa county, with a $300,000 capital, to deal in lands, build canals, etc. Walter Bennett, Phœnix, Arizona, is secretary.

—Nelson, B. C., reports that the Kaslo-Slocan railway contractors have a force of 800 men at work and are actively pushing things ahead at several points. The engineers of the Canadian Pacific railway have finished the survey of the extension of the Nakusp & Slocan railway to Sandon, the objective point of both lines. They find that their grade from the present terminus of the line at Three Forks will be over four per cent.

—From 1880 to 1890 valuation of property in California increased 88 per cent. In the same period there was an increase of 49 per cent for the whole United States. The valuation per capita in California increased 35 per cent, as compared with 19 per cent for the whole country. California ranks twenty-second among the States in population, but ranks sixth in total wealth or valuation of property. The tax rate per $100 on total assessed valuation decreased in California from $2.16 in 1880 to $1.70 in 1890; 21 per cent. For the whole United States the tax rate increased from $1.83 to $1.85 in the same period.

—In 1850 the total valuation of California manufactures was $12,862,522; that of the United States $1,019,106,616. In 1880 those of California increased in valuation to $116,218,973, and of the United States to $5,369,579,191. In 1890 the total valuation of California manufactures had increased to $213,403,996, and of the United States to $9,370,167,624. For the period from 1880 to 1890 the increase in the output of manufactures for California was 84 per cent, as compared with 74 per cent for the whole United States.

—It is now proposed to reorganize the Northern Pacific Railroad by replacing all the existing stocks and bonds, aggregating about $245,000,000 nominal value, by $100,000,000 of capital stock and not to exceed $200,000,000 of 4 and 3½ per cent bonds, of which $30,000,000 will he reserved to acquire branch roads and for construction, the Great Northern Railway Company to guarantee the new bonds, principal and interest, and in return to receive one-half of the capital stock of the reorganized Northern Pacific.

—The next Mechanics' Institute Fair, which will open at the Pavilion in this city August 12, the 28th industrial exposition so given will make prominent the matter of home industry. California manufacturers will have opportunity to exhibit the process of production as well as the finished article. There will he eight divisions: Manufactured products — machinery; manufactured products — metals, stone, marble, glass; manufactured products—wood, or wood and iron; manufactured products—animal and vegetable products; electrical, scientific and decorative arts; fine arts; chemical products; natural and food products. There will be forty-six subdivisions. The officers of the Institute well say: "Without the earnest and active co-operation of those engaged in these industries the efforts of the Mechanics' Institute in this direction must avail little. The Board of Trustees therefore strongly urges upon all firms and individuals engaged in mechanical and industrial pursuits to second the effort of the Institute to carry into successful operation this enterprise. No industry is so great that it can profitably ignore public recognition, and none so small that public attention will uot he of benefit to it. Representatives of all industrial and manual trades and handicrafts are invited to exhibit. None will be considered too small or insignificant to be accorded space for its display. No charge of any kind is made for exhibition and power; steam and water are also furnished free."

Girard Water Wheel in Power Development.

The rapid advance made in the development of water power on the Pacific coast has aroused an interest second only to that in mining, and the success which has been attained is rapidly producing its effect, as is shown by the continually increasing number of installations. While plans are constantly being suggested and rapidly adopted for rendering the mountain streams available for power purposes, yet the demand for such power is growing more rapidly than the supply, the consequence of which is that water powers are becoming more valuable as time goes on, and greater refinements are being introduced, particularly in respect to regulation and economy of use. This is notably the case in the operation of improved mining and milling machinery.

Electric machinery requires for its successful aud satisfactory operation accurate and automatic regulation. In the use of dynamos for electric lighting the safety of the lamps can only be secured by a governing apparatus which is quick, sensitive and unfailing. An increase of speed for a very short time may burn out all the lamps on a circuit, and a fluctuating speed, though the changes be small, materially lessens the life of the lamp.

The methods in use, which disregard economy of water and speed control, are no longer permissible, for au electric plant, whether it be for producing light or power, is uot properly operated unless its regulation he equal to that obtained from the hest steam engines; and as water usually has a value, and as its value will he on the increase, there is every reason for making its consumption conform to the work it is doing at any moment.

There is a wide difference hetween the control of steam and water power. Steam being elastic can be throttled without much loss, as it expands and performs work in proportion, but throttling water means a direct and serious loss. The introduction of a butterfly valve or other obstructiou in the supply pipe does regulate speed to some extent, but it is only by reduciug the available pressure. The loss is two-fold, by reason of the decreased pressure, and the fact that the proper relation hetween the spouting velocity of the water and the speed of the wheel is not preserved.

These facts lead to the conclusion that while throttling may operate well in steam engiues, it is not allowable in water-power development. There can be only oue successful method —control of the size of the issuing stream—and this must be done hy a quick-acting hut not over sensitive governor. What is needed is a governor which goes into service on a slight change of load, uot one which depends upon a change of speed.

Centrifugal or ball governors have heen tried in all forms and applied to all kinds of intermediate mechanism; they have been used to direct the power obtained from the wheel through a belt, to control valves operating hydraulic cylinders and to control the ratchet and pawl. None of these have given satisfaction and they are being abandoned very rapidly, in many cases "man regulation," for want of something better, superseding them.

The difficulty lies in the fact that there are too many steps in the mechanism: First, change of speed; second, vertical movement of the balls; third, operation of the governing power, and then time is required for the effect to reach the wheel and alter its speed. All this may *correct* a fault, but cannot *prevent* it.

The Girard Water Wheel Compauy has heen giving especial attention to this subject of water-wheel regulation, and it has perfected and put into practical use, what has been regarded heretnfore as impracticable, an efficient contracting nozzle, operated by a quick-acting and reliable governor.

The latter is so constructed that the entire load passes through it, and by means of a simple arrangement of springs and weights this load is weighed, just as it would he on a pair of scales, and *changes of load* are instantly indicated by the scales. It is not necessary to have a change of speed to set the governor in operatiou, and on this fact rests the secret of its success.

To render it very sensitive the governor is made to do no more work than is required to move a well-fitted and balanced valve, which connects, through large ports, to a hydraulic cylinder, where water under pressure is kept ready to open or close the nozzle. These connections are so close that the nozzle changes before the speed of the wheel can alter.

The Girard wheel can he regulated to any extent for varying quantities of water. This is of great advantage in localities where the supply varies during the year.

There is no change in any of the mechanism to accomplish this result, for as the supply decreases the work done by the wheel is decreased, and the governor automatically closes the nozzle. Thus it may he seen that it is only necessary to keep the work to he done within the limits fixed by the quantity of water.

The construction of these wheels allows a very large volume of water to he applied, while they are well adapted to small quantities, rendering them equally efficient under very high and very low heads. Owing to their practical advantages in these respects, they are very largely used on the continent, and have, to a great extent, superseded all other kinds.

The ability to use large volumes of water makes it possible to employ wheels of comparatively small diameter, and renders possible, in many cases, direct connection hetween the wheel and the machine to be driven, thus avoiding the use of belts and counter-shafts. S. LUCIEN BERRY.

San Francisco, June 19, '95.

Mechanical Progress.

Correct Costs, or the Parallel Column in the Counting-Room.

HENRY HESS, in *Machinery*.

The usual method of determining the cost of product consists in adding actual cost of raw material, actual cost of labor and shop expense. Shop expense is usually determined annually by subtracting from the total expenses of the business the sum of the expenditures for raw material and labor, and dividing the balance by the annual labor cost; the resulting ratio then gives the average relation of labor and shop expense for that year, and is used as a basis for the next year's costs.

COST OF A SMALL MACHINE BY USUAL METHOD AS ABOVE.

Big Shop.		*Little Shop.*	
Raw material	$100.00	Raw material	$100.00
Labor	160.00	Labor	178.00
Shop expense at 125 per cent of labor.	200.00	Shop expense at 50 per cent of labor.	89.00
Total	$460.00	Total	$367.00

Total cost in big and little shop differs by $93, or is about 25 per cent more in the big shop than in the little one; yet for both raw material is the same, while as regards labor the better equipment of the big shop gives it somewhat the advantage. But the little shop can sell at a profit at a price that means apparent loss to its big competitor.

DETERMINATION OF SHOP EXPENSES, USUAL METHOD.

Big Shop.		*Little Shop.*	
Year's cost of raw material	$ 200,000.00	Year's cost of raw material	$ 10,000.00
Year's cost of labor	2,000,000.00	Year's cost of labor	100,000.00
Total	$2,200,000.00	Total	$110,000.00
Grand total of year's exp'es.	$1,700,000.00	Grand total of year's exp'es.	$160,000.00
Shop exp.	4,700,000—2,200,000 = 1.25	Shop ex.	160,000—110,000 = .5
	2,000,000		100,000
	Or 125 per cent of labor. Or 50 per cent of labor cost.		

DETERMINATION OF COST, CORRECT METHOD.

Small Machine.

Big Shop.		*Little Shop.*	
Raw material	$100.00	Raw material	$100.00
Labor	160.00	Labor	178.00
Interest and depreciation of tools actually used on small machine, for time of such use	68.00	Interest and depreciation of tools actually used on small machine, for time of such use	50.00
General expenses	39.00	General expenses	35.00
Total	$367.00	Total	$363.00

Total cost for a big and little shop is substantially the same.

Large Machine.

Big Shop.		*Little Shop.*	
Raw material	$ 3,000.00		
Labor	8,000.00		
Interest and depreciation of tools actually used on large machine, for time of such use	9,000.00	Cannot build it.	
General expenses	1,400.00		
Total	$21,400.00		

From the total year's expenses subtract the sum of the year's costs for raw material, for labor, for interest and depreciation of tools and plant, in so far as they have been charged to individual product. Divide the balance by the total cost of labor plus the above total charge for interest and depreciation of tools and plant, and the result will be the desired ratio. In other words, each tool is to be regarded as a workman having a fixed rate of pay, made up from the cost of power delivered to such tool, the interest on first cost, the depreciation, the interest on cost of plant required to house such tool, and the depreciation of this housing. The interest and depreciation of tool and plant during the time when they are not in use will show up in the general expense ratio, which will therefore be somewhat higher for the large than for the small shop.

For the big shop and small machine the elements of general expense plus actual tool cost will figure out as 66.7 per cent of the labor cost, while for the large machine they increase to 130 per cent. Evidently increasing size of machine increases this ratio; and this is correct, since to build large machines requires a costly outfit of large tools and much real estate to house them and the product. It will not do to strike an annual average ratio, as is usual, because this results in an apparent increase of cost of the small work and an apparent decrease of the large; and it is not true that the ultimate financial result to the shop is the same, as the assumption that the overprofit on the small work pays for the underprofit on the large, for the simple reason that the small work goes to the competitor with the small shop, and apparently lower shop expense.

The correct cost of a given product is the cost of the raw material plus the cost of labor, plus the interest and depreciation of that part of the total plant directly concerned in its production during the actual time of such use, plus a general charge due to those factors of cost which are not directly chargeable to any particular product. In some establishments this general charge will most correctly take the form of a percentage on the labor, plus plant cost, while in others the cost of raw material rather than labor will be used as a basis for this ratio.

Self-hardening Steel.

There is great diversity in the material which is offered as tool steel. Some of it will harden well, and will soften proportionately to the color tests as the hues on the brightened piece magically change with the increment of heat from pale straw to yellow, brown, pink, red, purple, blue, and so on to the greenish blue that precedes the glow of light which marks the departure of the last vestiges of hardening temper. This is the genuine carbon steel. There are, however, says B. F. Spaulding, other kinds of steel which occupy a place which carbon steel will not fill. These are what are known as self-hardening steels.

In doing certain operations with cutting tools on iron and steel, they are not subjected to such excessive strains that heat is necessarily engendered to such a degree that it would soon destroy the efficacy of a tool made of carbon steel. It would produce in it just that degree of softness that would —with the pressure and motion—just fulfill the conditions of cold-welding, and the particles of the substance of the tool would unite with those of the substance acted upon, with the result of tearing away the substance of the point of the tool and destroying its cutting ability.

Self-hardening steel is a kind of steel which is hard when in its normal state, as it cools naturally in the atmosphere. It is not necessary to quench it in water or to cool it rapidly from a red heat in any manner. It becomes soft enough to be shaped into simple forms when red hot. It is of a nature that will not endure a white heat, and it is at a much higher temperature at a white heat than wrought iron is when it is equally luminous. It throws a dark red spark from the emery wheel when there is much carbon in its composition.

The employment of the self-hardening steel is rapidly extending. Wherever it is used it overcomes in a short time the prejudice which its use generally meets. Tool dressers are not favorably disposed towards it at the start, because it is very hard to work into shape upon the anvil and nothing whatever can be done in the way of cutting or bending it when it is cold. After the tool comes back to be dressed over, there is some danger that defects may disclose themselves upon reheating.

Scientific Progress.

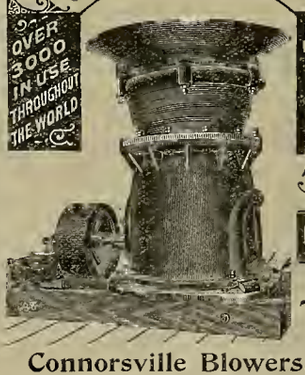
Probable Source of Helium.

When chemist Ramsay discovered, in a rare Norwegian mineral a few months ago, the gas helium, which had previously been found only in the sun and a few stars, the natural inference was that this interesting element had probably existed in association with the other materials composing the earth, ever since our globe was first formed, countless millions of years ago. But two hints, coming from different sources recently, suggest another possibility. It is only a few weeks since the *New Science Review* published a paper in which William Crookes, a leading authority in spectroscopy in England, remarked that most of the rarer metals, like erbium and yttrium, were found in the northern hemisphere—a fact which might perhaps indicate, it seemed to him, that they had an extra terrestrial origin—were deposited on the earth, in fact, during a meteoric shower of sufficient length to permit of at least one complete diurnal rotation. And now, in a brief note to M. Berthelot, of the French Academy of Sciences, Professor Ramsay declares that helium has been found in company with a number of rare metals, and has been detected in a specimen of meteoric iron picked up in Augusta county, Va. Probably this last mentioned chemical achievement was one of Ramsay's own. The meteorite, it may be reasonably inferred, belonged to some collection in London to which he had access. Although obtained in a gaseous form, helium (like hydrogen) is technically a metal, and the actual demonstration of its presence in a small body which is actually known to have reached this planet from outer space renders Mr. Crookes' fascinating suggestion the more credible, and admits the likelihood that cleveite, the mineral from which he first isolated the gas, also came from the skies, if not during the present century, at least within a very remote period of the earth's history.

Conjectures of this sort naturally revive the old question as to the unity in character of the materials out of which the planets and stars are made. Less than seventy elements are now recognized in the earth's crust. Only about forty of them have yet been spectroscopically identified with substances found in the sun. If we must reject helium and some others from our comparison, because they have come to us in meteorites, then the relationship between the sun and earth will become less obvious than before, especially when we remember that there are hundreds, even thousands, of lines in the solar spectrum yet unrecognized, and suggesting—we cannot yet say proving—that the great source of light and heat of our planetary system contains a number of elements not existing in the earth. Before the central portion of the great nebulous mass, out of which the sun and planets were formed, had shrunk enough to leave behind in space the independent rings in which the smaller orbs are believed to have had their origin, had the distribution of component elements ceased to be uniform? Did Neptune, Uranus, Saturn, Jupiter, the nameless body of which the asteroids are regarded as the wreckage, Mars, our own globe, Venus and finally Mercury each monopolize certain materials not assigned by gravitation to the others or to the sun? Again, whence come these tiny visitors from space, bearing, if really they do bear, samples of stuff not left in the terrestrial mass at its birth? Some of them, perhaps, have been ejected from the sun during eruptions of almost inconceivable violence; others, certain astronomers think, are the remnants of effete and disintegrated comets which have come from regions lying quite beyond the solar system. The general tendency of all discovery is to show that the whole universe is composed of very much the same matter and governed by the same laws; but there are differences in detail, and possibly we have one of them here.

PROFESSOR BELL believes that telephoning by means of a beam of light will yet be commercially practicable. This belief has grown out of a long course of experiments with selenium, which is marvelously sensitive to the influence of light, when exposed to which it gives vibrations that can be electrically transmitted. Prof. Bell's story of the way in which he became convinced of the possibility of telephoning without wires is interesting. Some years ago he had fixed a thin, highly polished reflector in such a position that it directed the light from a distant schoolhouse roof through the window of his laboratory in Washington, and a friend who was assisting him stood on the schoolhouse roof. As Prof. Bell described it: "A bit of selenium was placed in a test tube and all was in readiness. All of a sudden, as I was listening, out of a sunbeam came these words, "Mr. Bell, Mr. Bell! If you hear what I say come to the window and wave your arms." Prof. Bell considers the success of these experiments as even more wonderful and of greater significance than was the discovery of the telephone, which has become such a marvelous factor, an essential element, in modern business and development.

GATES ROCK AND ORE BREAKER



PRODUCES A MORE PERFECT CUBIFORM MATERIAL AND A GREATER QUANTITY IN A GIVEN TIME PER HORSE POWER USED THAN ANY OTHER CRUSHER ON EARTH.

CAPACITIES UP TO 150 TONS PER HOUR. NINE DIFFERENT SIZES

WE HAVE BUILT THE LARGEST STONE CRUSHING PLANTS IN EXISTENCE

GENERAL MINING MACHINERY

OF EVERY DESCRIPTION.

Electrical Progress.

The Pennock Electric System.*

By J. J. SWANN.

About every so often the newspaper public is startled by reading of some remarkable discovery in electricity which will revolutionize the world. The large majority of such schemes never go farther than a few columns of newspaper talk, after which they die from some more or less good reasou. The Pennock system is an exception to the general rule and in the hands of Mr. George B. Pennock, its inventor, still exists in a very flourishing coudition, if dependence can be placed in the prospectus issued by the company. Generally speaking, it is wisest to pay no attention to revolutionists in electrical as well as in civil life until they reach a certain danger limit. The claims of Mr. Pennock and his associates are, however, so sublime and certain, that they have reached this limit aud cannot be iguored—besides the system brings out several interesting points worthy of notice.

To begin with, if we have a current of sufficient strength to heat the carbon of an incandescent lamp, and reverse it slowly, the carbon is alternately heated and cooled. As the periodicity increases the flickers grow more and more frequeut uutil at about 30 per second, or 1800 per miuute, the flashes blend and the light becomes constant as far as the eye can detect. In practice, about 50 periods per second are used, giving a clear smooth light.

If instead of alternating the current we simply make and break a direct current, the same effects are produced, flashes growing more and more frequent as the speed of the contact-making device is increased, until, at about 2000 per minute, a steady light is produced, which, as far as can be seen, is the same as that of the alternating lamp. An ordinary induction coil with a lamp in series with the primary will show this. And it might be interesting to note that this method can he used to regulate the candle power of lamps; for, hy varying the speed of the contact-maker the light may be varied from nothing to full candle power—the curreut changing in direct proportion to the speed.

The foregoing explanation regarding alternating and pulsating currents will he clearer if we remember that all direct currents are more or less pulsating. Thus we see that lamps can be run in the ordinary way—in series or in multiple—on a pulsating as well as on an alternating current.

It is at this point Mr. Pennock steps in with an instrument or machine he calls a voltage distrihutor. To avoid mistakes the following is quoted from his patent: "The object of my iuveution is to provide a means of distrihuting an electric current from the same source of supply to a number of distinct and independent electric circuits, for the purpose of supplying lamps, motors, etc., with currents of the necessary electromotive force, so that no matter what change is made in one circuit it will have no effect in or on any of the other circuits, and no matter at what potential the current is kept in one circuit, an altogether different potential can he kept iu the other circuits, dependiug altogether on the resistance of each iudividual circuit. I attain my object, first, hy means of a rapidly rotating mechanism, arranged to send a current of electricity through a number of different circuits in rapid succession, combined with any source of electric power, but preferahly with a primary battery or hatteries. * * *

" * * * A rapidly rotated metal arm is arranged to come in contact in rapid succession with a numher of metal disks or segments arranged in a circle on a fire-proof non-metallic plate, such as slate, marble or similar suhstance.

" * * One eud of each circuit is connected to one of the segments, and the other end to a general return wire. The hattery is connected, one pole to the general return wire and the other to the rotating arm. Now, hy rotating the arm very rapidly, a current of electricity is kept flowing through the different circuits without any appreciahle break, and, as the circuits are completely independent of each other, the resistance and current in each circuit can be regulated to suit its individual requirements irrespective of the others; and throwing on or off the lamps in one or more of the circuits will have no effect on the lamps in the remaining circuits. Two thousand interruptions of the current per minute in an incaudescent lamp will deceive the eye into the belief that the light remains stationary—that is, the curreut leaves the lamp for an instant and returns to it again. Thus, so far as the eye can detect or the motor effects inform us, so rapid is the intermittent transference of electrical force that the power may practically he said to be in a hundred places at once, exerting its full capacity."

So far we will allow that nothing particularly remarkahle has heen encountered, although some might dispute several statements just made.

The next step launches us into the supernatural, for Mr. Pennock states that all these lamps conuected to his voltage distributor, whether 10 or 10,000, can be illuminated to full candle power with the current of one lamp. The explanation of this claim is given as follows: As the revolving hrush is in contact with only one segment at a time and we have only one lamp connected with each segment, it is evident that no more current can flow in any one of the circuits than the lamp and circuit resistance will admit. As the arm revolves, circuit after circuit is completed, but no more than one circuit at a time is receiving curreut. Thus we have just as many lamps as segments illuminated with the current of one lamp. In case several lamps in multiple are connected to one segment, the current will be only what one circuit would require. To operate motors, cars, etc., the same device is used, the motor being inserted just as a lamp would be.

In a test of this system made May 4, 1895, in the physical laboratory, Cornell University, the following results were obtained: A circular hrass disk was constructed and sliced into ten segments. An arm provided with a brush was revolved at speeds varying from 0 to 5000. The candle power figures are not absolute, since no photometric measurements were made. In fact, such were unnecessary, for the differences were only too apparent.

Each segment and the arm were conuected with a hinding post for convenience in handling. To start with, one lamp was connected to segment (1)—the circuit being from line through the lamp to (1), thence through arm to the other line, each time it touched on (1) in its revolution. Placing the brush on (1) and starting while the lamp was at full C. P., the instant the hrush left the segment the lamp flashed quite perceptihly uutil a speed of about 1800 was reached, when the carbon assumed a steady glow, though scarcely more than a dull red. Increasing the speed gradually to even 5000 revolutions made no appreciahle difference in the C. P., current readings remaining practically constant. Connecting (1) and (2) so current was flowing for $\frac{2}{10}$ of a revolution, the C. P. increased a small amount but remained constant with varying speeds as hefore. By adding one segment each time and thus allowing currents to flow for $\frac{1}{10}$ of a revolution more for each segment added, the light increased with each addition, remaining constant regardless of speed.

Trying different combinations of segments, such as every other one (1—3—5—7—9), every third one (1—4—7—10), etc., produced no change. The C. P. in each instance depended only on the number of segments connected and not on their relative position.

Connecting one lamp to each segment and repeating, increasing speeds as hefore, each lamp acted as first explained, giving only $\frac{1}{10}$ its C. P., the sum just equaling the light of one lamp. Connecting lamps to two segments, making five in all, each lamp emitted $\frac{2}{10}$ its C. P.—the five giving $\frac{10}{10}$ or equaling one lamp.

No. of lamps.	Ratio of contact.	Equivalent No.
10	$\frac{1}{10}$	1 lamp.
5	$\frac{2}{10}$	1 "
2	$\frac{5}{10}$	1 "
1	$\frac{10}{10}$	1 "

The same will be true of 100 segments, and so on, limited only by mechanical difficulties. In any and all cases the light obtained per lamp varies directly as the ratio $\frac{c}{2\,n}$, where c is the angle through which contact is made. As c increases, the fraction approaches 1 as a limit, or when $c = 2\,n$, $\frac{c}{2\,n} = 1$, or we are getting current for one lamp. As c decreases, the light decreases until $c=0$, when no light is given out. The same holds true in the case of motors or any other electrical machinery.

We now have data for solving the problem. Suppose we take a 50-light machine, 110 volts. Under ordiuary circumstauces this would run fifty 110-volt lamps each giving 16 C. P. This means $.6\times50\times110=3300$ watts and 800 C. P. Let us connect our dynamo to a V. D., and, as has been shown, if we wish to light 100 lamps, each lamp will get one-half its current and give one-half its C. P., or $100\times.3\times110=3300$ watts and $100\times8=800$ C. P., exactly the same, as before. Of course our lamps will burn dimly. If, however, we substitute one hundred 100-volt 10 C. P. lamps we will have 100 lamps burning brightly, but still only 800 C. P. The difference in size between a 10 C. P. and a 16 C. P. lamp is small, so the layman is greatly impressed by the brilliant light.

*From a paper read before the Electrical Society of Cornell University.

It has been asserted in Eastern journals that the Niagara Falls power scheme is a failure, a blunder, a colossal mistake; that the engineers promised more than they could fulfill, and that it is demonstrated in the tunnels the loss of power is so great as to make the electricity cost more in Buffalo than steam. It has been further asserted that only one thing remains to be doue, namely, to build up a big manufacturing city at Niagara Falls, and that the General Electric Co. has been invited to move its entire plant there. The Boston News Bureau claims that the electric generator in the power plant "is doing all and more than it was expected to do," and that the second one will soon be completed. "The Pittsburg Reduction Works, the largest aluminum works in the country, are in readiness to use the power as soon as they receive it, and the Carborundum Works are rapidly approaching completion." The Bureau's informant says: "I shall be disappointed if we don't find the power delivered to manufactories in the very early future, and there is no question in my mind hut the power companies are perfectly satisfied with their investment, and all tests made up to the present time."

The Harrison International Telephone Co., which started out to do so many great things, and which gave such reasonahle prospect of financial success, appears to he iu the vocative. The company makes a very nice report, hut something more substantial has thus far been vainly looked for. The original idea was to ally itself with the Postal Telegraph Co. The Standard Telephone Co., in this regard, seems to have secured that support.

The Leadville, Col., Electric Power and Irrigation Co., proposes to utilize the water power of the Arkansas river to generate 1500 H. P. to supply the mines and smelters in that vicinity with light and power. The estimated cost of the necessary work is $250,000.

The suhurban electric road idea is as awake in Alameda as in other counties of California. The projectors of the Haywards, Mt. Eden & Alvarado road now propose to build to Livermore.

THE AMERICAN MINING & MILLING MACHINERY CO.,

121 Euclid Ave., CLEVELAND, O. 280 Caxton Blk., CHICAGO, ILL.

SPECIALTIES:
AM. CRUSHER AND AM. BALL PULVERIZER.
The simplest, cheapest and best machines in the market. Pulverize wet or dry to any degree of fineness. Make little or no slimes in wet nor dust in dry work. Four sizes, capacity from 2 to 60 tons per day.
SEND FOR CATALOGUE. Cable Address, American.
First Prize and Gold Medal Awarded by World's Fair, 1893.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now calliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows less; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with less than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

Republican: The Argonaut shaft has reached a depth of 750 feet still in slate.

Some of the miners of the Mayflower whose wages are in arrear, have started to work the mine on their own account. Ten stamps of the mill are in operation.

At the Hazard a contract has been let to twelve men to sink a shaft 400 feet, 6x5 in the clear, at $12.50 per foot, contractors to furnish everything except hoisting power and engineer.

Calaveras.

THE GWIN MINE.—Teams are hauling timbers from the Hardenhurgh mine to the Gwin mine, for 50 cents a timber, large and small. The pipe from the mill and mine to the reservoir is taken up, hut the pipe from that up to the ditch remains in place, The reservoir is full of water. Two ten mule teams are hauling the machinery to the lone depot.

The Gwin mine is down over 700 feet in hard hlack slate, Alex. Quarto of Jackson Gate has the contract to mine the crosscut at the 700 foot level west of the lead. They are in fifty feet and a station is there. They have about 100 feet more to go to reach the ledge west of the shaft. Six men are in the crosscut and twelve in the shaft, each working three shifts daily. Sixteen inches of water is all that is used at the Gwin mine.

PASSED BY DEFAULT.—Angels *Herald:* The sixty days option given to Col. Shaughnessy on the Tulloch mine at Alhany Flat, has expired, and the Colonel not coming to the mark with the $50,000 cash the deal has heen declared off.

Humboldt.

GOLDEN PROMISE.—W. L. Loch and W. P. Wilson of San Francisco have filed on seven acres of land above Trinidad in a little natural harhor which runs into the bluff in a V-shape. The property has coarse gravel, and a local paper says contains $10.80 to the ton. The machine to he used to save the gold is an amalgamator, which uses mercury and is operated hy steam power. Between forty and fifty tons of gravel will he handled daily.

Kern.

AMALIE MINING DISTRICT NOTES.—Special Correspondence: Mr. George W. Cline, one of the proprietors of the Picnic mine, is making Los Angeles a visit. He is looking up mining men and mining interests.

The Dull hrothers are taking from their new discovery, the Mayflower, some fine-looking ore showing horn silver.

Mr. J. B. Ferris let a contract to Mr. Z. E. Foster to sink his thirty-foot shaft on the Darling Rosa fifty feet deeper. The work is ahout one-half completed and shows a fine lead. The Darling Rosa joins the Amalie on the southwest and is a promising piece of property.

The milling test made on the ore from the Picnic, as completed, shows up very nicely, running about $40 per ton in gold. This is a recent discovery, with ahout a two-foot lead, and is to say the least a very promising prospect.

Mr. Lanterman, Deputy U. S. Mineralogical Surveyor, has completed the survey of the Amalie mine for a patent and also the preliminary surveys on the Occidental, Darling Rosa, Sauser Extension, Little Jim, Horn Silver, Amalie Extension, St. John and Ferris mines. He has also set mineral monument No. 70 on the summit of the Amalie hill, which formed a hasis for all these surveys, and from which can be obtained a view of the entire surrounding country. The monument is a solid block of granite planted four feet in the mother earth, in the top of which is set a copper plate hearing the monument number and points of compass. G. E. F.

Mono.

THE STANDARD.—*Miner*: The Standard mill has started, having heen shut down to make changes for increase of power to mine hoist, mine pump, and tailing hoist. They have made a ten per cent increase of speed on alternating current generator and motor, now running at 1000 revolutions a minute.

There are two sixteen-inch helts running in tandem from alternating current motor at a speed of ahout 7000 feet per minute, one driving direct current generator for hoists and pumps, and the other driving mill. The alternating current motor was originally self exciting hut is now separately excited, thus doing away with the constant attention required to keep commutator brushes from sparking.

Nevada.

EMPIRE MINE.—*Tidings*: There has heen considerahle improvement in the Empire mine of late and that famous old property is looking hetter now than it has looked for the past year or more. The drift is heing run north in the 2100 level and a raise on the 2000 level is being made to reach the 1800 level. There is a good hody of ore in hoth levels.

Plumas.

SHENANDOAH MINE.—S. K. King, superintendent of the Shenandoah mine, has adopted a different method of working the ore. By means of a furnace, it will first be roasted, then milled and the gold amalgamated last. The furnace is now in course of construction, and other machinery will he shipped as soon as the roads are open via Oroville. With very little repairing, the mill will be ready to run.

QUARTZ MILL PURCHASED.—*National-Bulletin*: B. F. Gullio & Co., has hought of D. McIntyre his ten-stamp quartz mill at Wolf Creek and will immediately move it to the Hibernian mine south of Greenville. They expect to have it in position and ready for milling by the 10th of July. Ahout twenty men are now employed making a road and a foundation for the mill. The roads will he completed this week. Development work in the mine will he resumed immediately. The Hihernian promises to he one of the important mines of that section.

GREEN MOUNTAIN MINE.—T. D. McLeod is pushing the work of investigating the Green Mountain mine. Round Valley ditch water is used to drive the air compressor.

Crosscutting from No. 6 tunnel will develop such veins of ore as may exist there. The main tunnel will he driven ahead toward the Cherokee country. With a sixty-stamp mill supplied with excellent water power, timher handy, and produce purchasahle at very moderate rates, the Greeu Mountain mine can be operated at a profit on ore which, if less favorably situated, could not he made to pay.

El Dorado — Placer.—

THE ZANTGRAF BONDED.—*Republican:* E. W. Chapman has honded the Zantgraf mine, near Rattlesnake Bar. Wm. Graham is surveying a ditch line from Greenwood creek, which, when completed, will he utilized in running the stamp mill and dynamos for electric lighting, pumping, etc. The ditch will run by way of Pilot Hill and will be twenty-five to thirty miles in length, and a pressure of 350 feet will he ohtained. A new twenty stamp mill will he erected and other improvements will he made.

San Bernardino.

OF DOUBTFUL VALUE.—A prospector named Feeny, just in from Indio, tells the Los Angeles *Herald* of the discovery of wonderfully rich placer grounds ahout twelve miles east of the Cargo Muchacho, hy a man named Smith and his partner. They are said to have picked up hy hand $16,000 worth of nuggets in nine days, they having no dry washer and no water to pan with. Feeny says the location is one of the most dangerous on the whole desert, and that it would he suicidal for anyone not familiar with the trail and location to go there without competent Indian guides.

Siskiyou.

GENERAL NOTES.—*Journal*: Williams & Wademan of Yreka, are ahout to put in a concentrator.

Hossick & Brown, of the Eclipse mine, Humbug, are taking out $40 quartz.

At the Benz Bar claim, near Honolulu, on the Klamath, the miners are sinking on the second cut.

Songer & Dame are working the Pacific and McConnell mines at Klamath river day and night.

The Empire quartz mill, on Empire creek, Klamath river, has started up on quartz from a new portion of the ledge, where hut little sulphurets exist to prevent saving the gold, as the quartz contains free gold. After awhile concentrators will be produced to work the wide ledge containing sulphurets.

Shasta.

GENERAL NOTES.—*Searchlight:* The Shasta County Development and Mining Co. are improving their mines on the extension of the Iron mountain ledge which can be tapped at a depth of 1,000 feet from the surface. A recent assay from the ledge showed $56 in gold; sixty-two ounces of silver, and a small percentage of copper.

B. T. Merchant has purchased an interest in the Galena mine, situated in Sugar Pine Gulch, North Cow Creek mining district. This is a smelting proposition carrying gold, silver and lead. The ledge is twelve feet in width, in porphyritic slate, and four feet of mineralized ore on foot wall is exceedingly rich, carrying $187 gold, 40 oz. silver and eighteen per cent lead, which is sufficient to flux the ore. This assay was made by Mr. Rippeto, until recently of the Walker mine. A sample assay made by Julius Siebert, of the Eureka Tellurium, shows gold $7.54, silver 4.28 ozs., and lead sixty-four per cent. R. M. Sealtzer is interested in the mine, and R. Desmond is managing it. The property was located three years ago, but nothing hut the assessment work was done up to the present time. When the Iron mountain people erect their smelter, they can depend on this section for their fluxes.

The Eureka Tellurium is testing machinery, etc. All difficulties have heen surmounted and rock has been put through all processes ready for percipitation.

R. G. Hart, Sr., says the Cleveland Consolidated property has heen honded for $500,000.

THE TRINITY MINE.—At the Trinity mine, on Dog creek, formerly the property of the Trinity Consolidated Gold Mining Company, hut now in the hands of the Bank of Shasta County, who have bonded it for $300,000 for one year to J. W. Frank of Red Bluff, Wm. Fowler has a force of men doing development work.

Sonoma.

A PAYING CINNABAR MINE.—A Healdshurg dispatch says the miners of the Pine Flat district are enthused over striking a paying ledge in the Cinnahar King mine. For five years past work of development has heen carried on at a heavy outlay. Ore running from one to forty per cent has been taken out, hut a ledge now discovered is from six to thirteen feet wide and has heen followed for 112 feet. The ore at the surface will run one per cent and increases in richness as greater depth is reached. A mill and furnaces will prohably will be huilt.

Tuolumne.

THE CONFIDENCE MINE.—*Democrat:* Arrangements are heing made for the resumption of work on the Confidence mine. A. Hamilton, of Baker & Hamilton, is inspecting the property. The Confidence mine was a wonderful gold producer in the early times, and the history of the mine and the character of the ore are such as to convince the owners that it has not been thoroughly worked.

NEVADA.

ON THE COMSTOCK.—The official letter from the Occidental Consolidated mine for the past week says: Five hundred level—The winze from the north drift on this level has been sunk during the week six feet, giving a total depth of 53 feet, continuing in ore of the average assay value of $36 per ton. Five hundred fifty level—The west crosscut on this level is in a distance of 200 feet; advanced during the week ten feet. The face is in porphyry and clay, with hunches of quartz, and shows some value.

The following official reports have been placed on file:

CON. CAL. & VA.—1650 level—On the ninth floor (the first floor above the sill floor of this level) the drift south from the east crosscut from drift south from south end of stope has heen extended 12 feet: total length, 164 feet; face in porphyry and quartz of low value. On twelfth floor the drift south from east crosscut has been extended 20 feet; total length, 195 feet, in porphyry, with some low-grade quartz. On second floor from opening made from drift south from the east crosscut from main north lateral drift on sill floor of this level in working north have extracted seven tons of ore, assaying $60.85 per ton. 1750 level—The opening on the seventh floor above sill floor of this level has heen enlarged to 35 feet in length hy 6 feet iu width, and from this floor have gone upward with an opening 10 feet in length hy 6 feet in width for the eighth floor, carrying ore assaying $25 per ton. Along the west side of the eighth floor have cut into and exposed some timhers of old working. From the second floor up to the eighth floor above the sill floor of this level have extracted 164 tons of ore, making total extraction for week 171 tons, the average assay value of which per mine car samples was $50.33 per ton.

CHOLLAR.—The winze from the 650 level is now down on the slope 33 feet, baving been sunk 19 feet since last report; hottom is low-grade quartz and porphyry. On the sixtb floor of the slope above the 650 level have started a drift which is now out 10 feet in fair-grade ore. On the 550 level we have started a west crosscut 400 feet south of north line, which is now out 15 feet in porphyry. We have started a raise from No. 2 west crosscut on 450 level, 120 feet north of south line, which is now up 25 feet; top shows an 11-inch streak of ore, running from $25 to $35 per ton. During the past week we have extracted and sent to the Nevada mill for reduction 90 tons of ore, the hattery sample of which was $34.56 per ton.

POTOSI.—The east crosscut from the end of the south drift on the 550 level is out 136 feet, having heen extended 12 feet for the week; the face is in porphyry. The raise from the south drift, 550 level, continues to show a streak of ore ten inches wide of fair grade, from $25 to $30 per ton.

HALE AND NORCROSS.—975 level—The south drift from west crosscut 1 was advanced 6 feet; total length, 182 feet. Have stopped work in the face of this drift. Have started east crosscut 2 in our south drift at a point 115 feet south of east crosscut 1 and advanced the same 5 feet; face in porphyry. West crosscut 3, near our northern boundary, has been extended 10 feet; total length, 142 feet; face in porphyry and stringers of quartz. Have done considerahle repairing on this level the past week. Intermediate level—Have advanced south drift 12 feet; total length, 58 feet; face in porphyry and small seams of ore.

CHALLENGE.—The west crosscut from the top of the joint Confidence and Challenge raise from the surface is out 78 feet; the face shows quartz of no value.

CROWN POINT.—From the tenth floor of the raise from No. 1 east crosscut on the 700-foot level they have started a crosscut to the west, which is now out 32 feet; the face is in quartz of no value. During the past week they have extracted from the stopes and shipped to the Mexican mill for reduction 613 tons of ore. The average hattery sample was $10.36, of which $9.24 was gold.

BELCHER.—On the 300-foot level the joint Belcher & Seg. Belcher south drift is in 258 feet from the shaft; the face shows quartz of no value. On the 1000-foot level the northeast crosscut from the north lateral drift is out 90 feet; face is in quartz and porphyry. They have hoisted during the week and stored in the ore-house at the mine 38 tons of ore, the average top car sample of which shows an assay value of $26.46 per ton.

SEG. BELCHER.—On the 200-foot level the southwest crosscut from the south lateral drift is out 96 feet: the face shows porphyry. There have heen hoisted during the week and stored in the ore-house at the mine 16 tons of ore, the average top car samples of which show an assay value of $70.18 per ton.

In most of the other Comstock mines during the week the usual prospecting work was done. No new strikes of ore are reported in the official letters.

WASHOE CO.

AN IMPORTANT INDUSTRY.—*Gazette:* The Reno Borax Company's teams arrived at the Humholdt House recently, loaded with 36,000 pounds of refined horax, from the company's plant near Granite creek, in this county. The company is manufacturing a ton a day now, and has shipped about 200 tons since the works started up. It is a growing and important industry in this county.

LINCOLN COUNTY.

FERGUSON DISTRICT.—Reports from Captain De Lamar's Jim Crow and Monitor properties, in Ferguson district, are that the output of the mill now reaches nearly $100,000 in gold hullion every month. The bullion wagon, with its armed guard, makes regular trips between the camp and Milford, Utah. The new mill is operating smoothly and saves a high per cent of the values. A new and larger water supply will soon be provided. Recent developments have shown up some splendid ore hodies in the mine. The lower development tunnel, which is to he 1,300 feet in leugth, has now reached a depth of 300 feet and is being driven ahead with all possihle speed. When completed this tunnel will serve as an outlet for all ore produced hy the mine.

ARIZONA.

THOMAS MINING CAMP.—Thomas mining camp is sixteen miles south from Blaisdel station on the S. P. railroad, in a spur of the Alvino mountains, Gila range, in Yuma county.

The general formation of the country rock is granite, quartzite and schist and shale capped hy dykes of hull quartz and lime spar. The stratifications run from east to west and the dip is southerly.

The veins are stratified and run with the country rock and dip at an angle of ahout forty-five degrees to the south.

The number of locations made up to the present time are twenty-two, the first and main discovery being known as La Fortuna mine. The shaft is an eight hy six opening and down about twenty-five feet, all in high grade ore and no walls perceptihle as yet. No waste has been taken out and the ore on the dump will be ahout seventy-five tons. A shipment was made to Selhy & Co. at Port Costa and netted about $70 per ton after paying all expenses. The amount shipped was one carload of 102 tons, and the expense amounted to ahout $40 per ton.

BRITISH COLUMBIA.

TRAIL CREEK PROPERTY.—At the North Star after thirty days' work the owners are ready to ship ore, and can turn out twenty tons a day. The ore is said to have assayed $40 to $125.

GENERAL NOTES.—Kamloops *Sentinel:* The Silverine, Caledonia, and Jackpot, Trail creek, have been honded and development work commenced.

The Rossland *Miner* gives the ore shipments for May from Trail creek at 1,923 tons, valued at $92,433.72.

There are 16 feet of ore in the west drift of the Le Roi at the 350-foot level, said to average $165 to the ton.

During May forty-four location records were filed in the Kettle river mining division, four transfers, and nineteen certificates of work.

The reported sale of the Cliff and St. Elmo consolidated claims in Trail creek for $110,000 has not yet been carried through.

THE WAR EAGLE MINING CO.—The War Eagle Mining Company have declared a dividend of $50,000,—ten cents a share.

This is the second dividend. The first was paid March 1 '95, 6½ cents per share, $32,500. The owners figure on paying quarterly dividends of $50,000. The mine is remarkahle in that it has neither machinery nor expensive huildings. It is operated by tunnels into the mountain, and its equipment consists of a rough hoard office, some ore hins, and the tools needed to develop and take out ore. It has no boarding-house, and the men eat and lodge where they please. Compressed air for the drills is had from the Le Roi, hut as the latter mine now has use for all its air, the War Eagle is arranging to put in a twenty-drill compressor of its own.

The War Eagle Company own five claims—the War Eagle, the Iron Mask, the Virginia, the Butte Fraction and the Poorman Fraction. On all of these it has ore, and it is developing them slowly.

A peculiarity of the Trail creek ore is the wide range of values. Ore taken from one vein, and apparently the same, may run $50, $100 or even $150 when assayed, and again it may return only a trace. The only way to get a correct average value is to run a drill across the vein and assay the dust taken from the drill hole. This uncertainty misled many a prospector and mining man in the early days of the camp.

COLORADO.

EXTRACTION WORKS.—Superintendent P. Argall of the Metallic Extraction Works has gone to Denver with a 600-ounce gold ingot, the result of a two-weeks' run of the new cyanide works recently completed at Florence. The result of the refining department of the plant, like all other departments, by this clean-up has proven a complete success. The company has placed an order for two additional crushers for the works, which will double the present crushing capacity.

IDAHO.

"AN ACCIDENT."—Sturgill Bros., on Snake river, while deliherating over the sale of the placer claim for $10,000, had a cave-in on the hanks, and, the Lewiston *Tribune* claims, picked up $14,500 in nuggets hy hand after the accident. This claim is not for sale at present.

UNEXPLORED MINERAL DISTRICTS.—Lewiston *Teller*: There are several unexplored mineral districts in Idaho which are worthy of consideration from the prospector. In Lemhi county, the Salmon mountains, in Idaho and Shoshone counties, the Bitter Root range, with its spurs in Kootenai county, north of the Kootenai river, all afford rich fields for the search of minerals. There are two districts that deserve special mention. These are the Clearwater country, in Idaho and Shoshone counties, of 2500 square miles, and that district in Kootenai county which lies between the Yahk river and the west line, 1300 square miles. Both these districts, while very little known, have heen proven to be mineral-hearing.

MONTANA.

AT ROCKER.—*Inter-Mountain*: H. L. Frank and others of Butte have a promising gold property just across the creek from the town of Rocker, whiob with development work will prohahly prove to he rich in gold. The mine is one known as the old Rooker, from which some $40,000 in gold was taken iu the early days. It was worked at that time with an arrastra and many old miners who worked

about Rocker in the sixties believe that from this rich ledge came much of the placer gold found below Rocker. The present owners jumped the claim last January and started in to thoroughly develop it. After sinking a shaft forty feet they struck the old workings, which necessitated an abandonment on that portion of the mine. Recently a contract was let to sink another shaft 200 feet near the east line. Some of the ore taken out during development work is exceedingly rich, much of it having an assay value of $2,500 to the ton.

OREGON.

THE TOLO MINE.—C. O. White, who put in the Tolo pumping plant, and who has been superintendent of the mine, has gone to Tacoma. N. M. Milner has been appointed in his stead. It is said Mr. White will for an Eastern syndicate put in a pumping plant similar to that at Tolo, in Alaska, for mining purposes.

A BIG NUGGET FIND.—It is reported in Grant's Pass that Eli Taylor recently found on Powell's creek a fourteen-pound nugget in one place, and a thirty-one-pound nugget in another, the two assaying $8500.

BAKER COUNTY.

GENERAL NOTES.—John Longmaid is operating the Eureka and Excelsior mines, forty miles west of Baker City, and keeping a twenty-stamp mill, together with a cyanide plant of twenty-ton capacity, with ore that yields $20 gold at the mill.

The La Bellvue is working with thirty men at Cable Cove on high grade ore, the mill returns showing eighty ounces silver and $20 gold. The property has been purchased by a Cascade syndicate.

The Red Boy at Granite, with a ten-ton Crawford mill, is said to be netting $4000 a month; the Bonanza is yielding $14,000 a month. The Pyx is a new property at Granite, upon the ores of which a thirty-day run was made with very satisfactory results.

The Downey placer in Sumpter valley, is rented to Chinamen, who pay $300 a week for the privilege of sluicing its sands that average seventeen cents a yard. They have made a proposition to the company to lease the bar for six years, agreeing to pay $300 a week during the seven months of the working year.

The Jennings & Kimball placers near Granite are working night and day upon a bar which measures 7,000,000 yards, the average value of which is eighteen cents, and with 2000 miner's inches of water with which to handle the gravel.

UTAH.

THE CYANIDE SUIT.—Producers of gold ores and owners of cyanide plants are interested in the suit of the American Gold and Silver Extraction Company (limited) against the Mercur company, which is using the cyanide process and formerly paid a royalty of $1 per ton. The users of the cyanide process all over the West are not backing the Mercur company in this suit. The only assistance it receives is from the Marion company, which also operates a cyanide plant in the Camp Floyd district.

The contention of the Mercur company is that though the cyanide patent covers a process for the extraction of gold from ores containing base metals, it will not treat such ores. The Mercur people claim that in each case in which the cyanide process was applied to the refractory ores of the Camp Floyd district it proved a failure.

CENTENNIAL-EUREKA.—The Centennial-Eureka last week paid a $30,000 dividend, making a total in dividends to date of $1,140,000. Upon a basis of $1,500,000, it is now paying two per cent per month, or twenty-four per cent per annum, a record that has been kept up for nearly five years, and which, with ore bodies now in sight, should be kept up for an indefinite period.

WASHINGTON.

BONDED FOR $100,000.—A sale of the Ontario and Black Republican mines near Leavenworth is about made. An option on these properties has been secured for sixty days by Puget sound people. The Ontario is the property from which the ore was reported by the Demerside Smelting and Refining Company, of St. Louis, as containing nickel, cobalt and copper, aggregating a value of $149.53. The agreement is that the Puget sound company shall have twenty days in which to make a bond; that the bond shall be for $100,000, $10,000 of which shall be payable in ten days from the date of executing the bond; $10,000 more shall be paid in another sixty days. The balance is to be made in two even payments of $40,000 each in six and twelve months. Mr. Webber of Everett has been negotiating for the Puget sound company and is in Leavenworth looking after the details of the agreement.

COLUMBIA PLACER CLAIMS.—Spokane *Chronicle*: J. W. Young came in this morning from his placer claims on the Columbia river, sixteen miles north of Wilbur, bringing in a lump of gold weighing almost five ounces and valued at $90. He says it is the result of 2½ days' work for five men, averaging a little over $7 per day per man. He says there are about seventy men now working along the Columbia who are making good wages.

THE article on "California Clays—Stove Lining" in the issue of June 15, was written by C. B. Smith, vice-president Asbestos Paraffine Co., 128 and 130 First St., San Francisco, Cal., to whom all inquiries relative thereto should be addressed.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.
SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,
SACRAMENTO, CAL.

FRANCIS SMITH & CO.,
MANUFACTURERS OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with Asphaltum.

All kinds of tools. Fortune for the driller by using our Adamantine process; can take core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Practical Information.

Decline of Natural Gas.

The first rolling mill that used natural gas exclusively was the Etna Iron Works, near Pittsburg, Penn., and the establishment has been one of the last to abandon that fuel in the Pittsburg district. After twenty years of dependence upon natural gas the projectors of this plant have removed the pipes and are now returning to the use of coal, long after most of the other mills had surrendered to the cheap bituminous fuel which has always been the chief foundation of Pittsburg's great industrial prosperity. The diminishing supply and the constant increase in cost have necessitated the abandonment of natural gas by most of the large manufacturing establishments in the Pittsburg district, and its use is being more and more restricted to domestic purposes. Pittsburg has again become the smoky city of fifteen years ago, alleviated in some measure by the use of fuel oil and manufactured gas, which have assumed importance with the decline of natural gas in the last four or five years.

Natural gas was not a factor of very great importance in the Pittsburg district until early in the 80's, and the point of greatest consumption was reached in 1888, after which the decline began. It has never been feasible to ascertain with accuracy the quantity of natural gas consumed each year, but J. D. Weeks, of Pittsburg, has prepared for the United States Geological Survey an estimate of the value of the coal displaced by natural gas, which has been accepted as the most practical measure of the consumption of gas. In the period of its largest use the natural gas consumed in Pennsylvania, measured on this basis, was as follows: 1885, $4,500,000; 1886, $9,000,000; 1887, $13,749,500; 1888, $19,282,375; 1889, $11,593,989; 1890, $9,551,025; 1891, $7,834,016; 1892, $7,376,281; 1893, $6,486,000.

In Ohio the supply of natural gas has fallen even more rapidly that in Pennsylvania. The largest consumption in Ohio was in 1889, when it amounted in value to $5,215,000; but in 1893 it had fallen to $1,510,000. The suddenness of the failure of the supply has caused much inconvenience and loss to manufacturing establishments, which in many instances were deprived of fuel almost without warning. While the supply of natural gas in Pennsylvania and Ohio has been diminishing a new productive region has come into prominence in Indiana, and interest in natural gas is now centered in that State. In 1886 the value of the gas consumed in Indiana was estimated at only $300,000; in 1888 it was figured at $1,320,000, and in 1893 the value was placed at $3,718,000. The opening of this new field has stimulated the development of iron and steel and glass enterprises in Indiana in a marked degree. Notwithstanding the abundance of the present supply in Indiana, there is no assurance of its continuance for a longer period than in other States, and a return to fuels more stable, if less convenient, is merely a question of time. In fact, it is claimed by geologists and gas experts that the point of greatest supply has been reached. While it lasts there is no fuel that possesses so many advantages as natural gas. The uncertainty of its duration is its only disadvantage.

Oil on the Waters.

A simple device for distributing oil on rough water is meeting with adoption among shipowners. The arrangement is practically automatic, taking advantage, as it does, of the rise and fall of the vessel to create an air pressure, by means of which the oil is forced from the reservoir and mixes with the sea. Briefly, a tank is placed in a convenient position at the fore or after end of the vessel, above the water line, and is about three parts filled with oil, the remaining space acting as an air reservoir. In connection with and passing through this tank is a tube, the lower end of which is carried as far down as possible and is open to the sea, the upper part being fitted with an air valve to admit of the air pressed up by the column of water passing into the reservoir. In connection with the main tube an additional air tube is fitted immediately under the water line, which, when the vessel rises, admits air into the main tube, and by means of a valve prevents its escape. This air is acted upon by the column of water, which forces its way up the main tube by the pitching of the vessel, and a pressure of five to six pounds can easily be obtained, which, acting upon the air stored in the reservoir, ejects the oil through the distributing pipes to the sea.

Primitive but Effective.

At Bangalore, in southern Iudia, the quarrying of granite slabs by means of wood fire has been brought to such perfection that an account of the method is interesting. The rock forms solid masses, uninterrupted by cracks, for several hundred feet, and when quarried over an area, says *Nature*, is treated as follows:

"A narrow line of wood fire, perhaps seven feet long, is gradually elongated, and at the same time moved forward over the tolerably even surface of solid rock. The general splitting of the rock is accomplished with light wood, which has been left burning in its position until strokes with a hammer indicate that the rock in front of the fire has become detached from the main mass underneath.

"The burning wood is then pushed forward a few inches and left until the hammer again indicates that the slit has extended. Thus the fire is moved on, and at the same time the length of the line of fire is increased and made to be convex on the side of the fresh rock, the maximum length of the arc amounting to about twenty-five feet. It is only on this advancing line of fire that any heating takes place, the portion which has been traversed being left to itself. This latter portion is covered with the ashes left by the wood and with thin splinters which have been burned off.

These splinters are only of about one-eighth of an inch in thickness and a few inches across. They are quite independent of the general splitting of the rock, which is all the time going on at a depth of about five inches from the surface. The burning lasts eight hours, and the line of fire advances at the average rate of nearly six feet an hour. The area actually passed over by the line of fire is 460 square feet; but as the crack extends about three feet on either side beyond the fire, the area of the entire slab which is set free measures about 740 square feet. All this is done with, maybe, about fifteen hundredweight of wood. Taking the average thickness of the stone at five inches, and its specific gravity at 2.62, the result is thirty pounds of stone quarried with one pound of wood.

PITTSBURG talks of doing away with the smoke nuisance by erecting a mammoth electric power plant to furnish the city with current for electric lighting, heating and power, thus entirely doing away with the burning of coal in and immediately about Pittsburg.

Market Reports.

The Markets.

SAN FRANCISCO, June 20, 1895.

The metal market is strong throughout, there being a general advance. The Illinois Steel Co. report this week a raise of $2 a ton, which they calculate will increase their income $60,000 per month, their monthly output being now 30,000 tons.

The Copper circular of D. Houston & Co. of New York says:

Copper has also awakened from its dormant and lethargic condition, and is in a notably strong position. Since the middle of April the market for this metal has advanced fully 1¼ cents per pound in New York and from £4 to £5 per ton in London. The statistical position of copper, the condition of trade, the relations that the prime factors of supply and demand sustain to each other, are all of such character as to make the outlook very bright and promising. The consensus of opinion of those best qualified to judge is that we are simply on the threshold of a long period of sustained activity and prices, which will gather strength from purely natural and not artificial cause. The present improvement is regarded as simply the beginning of a decided forward movement that will become more pronounced as time progresses.

Negatively, the position of copper is strengthened by the fact that no artificial measures are in operation to inflate the market. An impression that the present advance could only be sustained by some sort of agreement between producers, whereby output and exports would be kept within certain limitations, has carried some weight among a certain class who have only a superficial acquaintance with the real situation. Negotiations between European and American producers, whereby a reduction of 5 to 7½ per cent in the foreign production, with a restriction of American exports to 60,000 tons per annum, formed the basis of agreement, have terminated without any arrangement at all. The Calumet and Hecla and Anaconda companies withheld their consent. It is believed by those high up in copper circles that the position is really stronger without any agreement, otherwise everyhody would be afraid it would break or end; now, however, the situation is entirely natural and sound upon its merits.

Under date of Liverpool, June 4th, James Lewis & Sons, in their monthly report on ores and metals, say, discussing copper: During the past month the speculative market has been subject to somewhat violent fluctuations, under the influence of favorable or unfavorable reports as to the progress of the negotiations to limit European production and American exports of copper, the final conclusion of which is the determination of the Calumet and Hecla Co., of Lake Superior, to decline to he parties to any such agreement, although assented to by all the otber mining companies concerned. Various reasons are assigned for this non-concurrence, that publicly announced being that tbe manager of this company considers any agreement unnecessary in view of the present active demand for copper in the United States, due to the very pronounced revival of trade, and that the desired object will be attained without the use of any artificial means. Definite proof of this improved trade is shown in tbe important advances in wages which are being generally conceded by producers and manufacturers, the Calumet and Hecla Company, amongst others, granting an increase of ten per cent on the wages of 3500 men employed by them. This will represent an increase in the cost of the copper produced by this company of at least £1 per ton, and follows a similar advance granted a few months ago.

It appears that in the month of April, the Calumet and Hecla Co. sold a large quantity, stated to be 12,500 tons of 2000 lbs., of their copper at 9.50 cents per lb. for delivery up to the end of August. The recent, or any further advance, cannot tberefore be of much benefit to them for some time to come.

It is stated by those most competent to judge that the exports of American copper to Europe will probably be less tban 55,000 tons for tbe present year. For the past five months they have been ahout 24,750 tons, against 30,724 tons for the same period last year, and 77,130 tons for the whole of 1894.

Tbere is little doubt that the private stocks of copper in France and Germany are very small, and that the public stocks in England and France will steadily diminish in order to supply the increasing consumptive demand.

English best selected ingots sold up to £48, closing at £47 per ton. For Lake Superior ingots £51 was paid, but the present value in New York of 10.75 cents per lb. (an advance of one cent) is tbe equivalent of about £53 per ton; and of electrolytic copper about £52 5s. per ton, Birmingham terms, little being offered for sale.

Mining Share Market.

SAN FRANCISCO, June 20, 1895.

The market improved some this week in volume and figure, Comstocks experiencing a general advance.

A special meeting of the Hearst Mining Company has been called for the purpose of deciding and voting upon a proposition to ratify a sale of all its mining claims known as the Alabama, Bailey and Humboldt, upon the Brunswick lode.

Regarding the Brunswick ground, the *Enterprise* says "operations are to commence immediately. Saturday, Superintendents Ryan, Keating, Gorham and Kervin and Engineer Haist spent the day in viewing the ground with a view to deciding upon a plan for immediate action. It is understood that two drifts will he started immediately from the tunnel—one toward the north aud the other toward the south. Fifteen men will be put on in eacb until it is decided to start upraises, when the force will be augmented. When the rich ore is struck, which the Brunswick is almost certain to contain, we shall see a rehabilitation of the old camp."

The following illustrates the changes of the week:

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Frederick Joubert, in the Joubert mine, near Oak Valley, Yuba Co., to impound tailings in an old pit and behind dams in Willow Creek; from Geo ge Parent, in the Tippecanoe mine, near Camptonville, Yuba Co., to impound tailings behind dams in Spanish Ravine; from W. R. & M. J. Williams, in the Galena Hill mine, near Camptonville, Yuba Co., to impound tailings in an old hydraulic pit; from E. C. Cochran and Charles Turner, in the Atom mine, near Camptonville, Yuba Co., to impound tailings behind dams in Williamson Creek; from William Wellman, in the Young's Hill mine, near Camptonville, Yuba Co., to impound tailings behind dams in a ravine, from M. V. Turner et al, in the Horse Valley mine, at Wood's Point, Yuba Co., to impound tailings behind dams in Horse Valley Creek; from Michael Cortez, in the Sailor Boy mine at Brandy City, Sierra Co., to impound tailings behind the Brandy City Co.'s dam, in an old hydraulic pit; from Fournier & Barrere, in the Charcoal Ranch mine, near Loganville, Sierra Co., to impound tailings behind dams on a flat; from D. O. Keefe, in his mine near Loganville, Sierra Co., to impound tailings in an old hydraulic pit; and from the Plumas Imperial Gold Mining Co., in its mine near Quincy, Plumas Co., to impound tailings behind a dam in Rock Creek, gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., July 8th, 1895, at 1:30 P. M.

Assessment Notices.

GOLD BAR CONSOLIDATED MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, La Porte, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of May, 1895, an assessment, No. 1, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of June, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, Cal.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of June, 1895, an assessment, No. 2, of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the corporation, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 27th day of July, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eleventh day of June, 1895, an assessment (No. 19) of Fi e (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the sixteenth day of July, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the sixth day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the twelfth day of June, 1895, an assessment (No. 45) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth day of July, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the seventh day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine St., San Francisco, Cal.

THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling Correspond with us.

WE CAN SAVE YOU MONEY.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LOCK NUT.—Charles G. Mortensou, Lorin, Cal. No. 540,508. Dated June 4, 1895. This invention relates to improvements in lock nuts. It consists of a polygonal nut having slits cut in one or more of its angles near the inner face, a plate or washer against which the nut is to be screwed, said plate having a convex surface with grooves or channels formed upon each side coincident with the sides of the nut when the latter stands parallel thereto, whereby the tongues or points formed upon the angles of the nuts may be forced into the channels and locked against the shoulders thereof.

STOVE AND KITCHEN UTENSIL.—Frank G. High, San Francisco, Cal. No. 540,548. Dated June 4, 1895. The object of this invention is to provide a device which is variously useful as a stovelid lifter, a lifter for pans or other articles where it can be made to grasp the edge, together with a scraper, a hammer, and means for extracting tacks or nails. It consists of a handle having a curved bifurcated tip at the front, an upward projection formed behind the tip, a wedge-shaped projection from the rear end with a groove or channel extending longitudinally along the lower side of said handle, levers fulcrumed midway of their lengths, one behind the other, within the channel of the handle, having their adjacent ends beveled and overlapping, a curved tip formed upon the front end of the forward lever corresponding in length to the lower portion of the handle tip, and adapted to be closed against it with a spring acting to normally hold the lever away from the handle tip, and leave an opening between the two for grasping articles, a swinging link pivoted to the rearmost end of the handle adapted to swing beneath the end of the rearmost lever so as to close it into the handle and close the jaws or tips at the front end to form a single continuous tip.

EGG CASE.—Moudula Leak and Wm. B. Hayford of San Jose, Cal., and Geo. L. Merguire and Louis D. Radgesky, San Francisco, Cal. No. 540,502. Dated June 4, 1895. This invention relates to an apparatus which is designed for holding eggs, fruit or delicate articles which it is designed to protect from injury during transportation and also a means for turning eggs when the apparatus is used for containing them, so as to prevent the yolks from settling to one side. It consists of an exterior closed case having a hermetically sealed closing door extending longitudinally along one side of the case, of a length approximating to that of the trays, an interior case or frame of approximately square cross section, having a central shaft journaled and turnable with the frame in the outer case, vertical and horizontal cleats or guides within the turnable frame, frames fitted to slide upon said guides and to be held therein, and curved elastic arms fitted in series to the frames to hold eggs or other articles by elastic pressure, so that they may be reversed without falling from the holders.

FUEL-GAS RETORT.—John Martin, Berkeley, Cal. No. 540,505. Dated June 4, 1895. This is a retort for generating what may be termed "fuel gas;" that is to say, a gas resulting from the combustion of fuel when mixed with the proper amount of air and properly generated and mixed in a retort from which it may be conveyed to any suitable point. The object of the invention is to obtain the highest efficiency of coal as a fuel by such a unison of elements therein under combustion, with a proper amount of air, so that the largest or highest number of heat units may result from each pound of fuel. The retort consists of a shell supported upon a closed-in side foundation, and comprising a foraminous bottom, vertical end walls and an arched roof which projects over and beyond the plane of the rear wall of the shell, so as to leave a clear roof space, and the upper portion of the front wall corresponding with the space inclosed by the roof, being provided with openings, a vertically slidable regulating plate controlling said openings, and means whereby the vertical movement of the plate is automatically effected.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

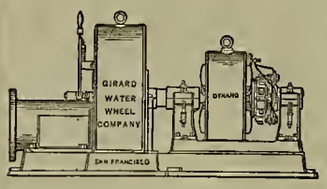
Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,
121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Girard Water Wheel Co.,

34 MAIN STREET, - - SAN FRANCISCO, CAL., U. S. A.

WATER WHEEL

CASCADE WATER WHEEL

Adapted to all heads, from 30 FEET TO 2000 FEET. Our experience of 33 YEARS in the water wheel business enables us to suit every requirement of water power plants. Send for illustrated pamphlet. This new wheel has given an unequaled Economy in Water.

GLADSTONE MINING COMPANY, C. J. Clark, M. E., Gen'l, Supt. FRENCH GULCH, Shasta Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

HAVE YOU A MINE? If so do not fail to see Parke & Lacy Co.'s Stock of MINING MACHINERY

SOLD AT LOW PRICES.

21 and 23 Fremont Street, - - - - - San Francisco, Cal.

IMPROVED CRAWFORD MILL.

The Cheapest and Best Mill for extracting gold from comparatively free milling ores. Requires one-third the water, and three-fourths the power of stamps. Costs less, is operated cheaper, and will save 20 to 40 per cent more gold. Average saving 85 per cent. Inexpensive foundation. No plates or screens. Wear and tear guaranteed not to exceed thirty cents per ton. Capacity ten tons. Full particulars,

MECHANICAL GOLD EXTRACTOR COMPANY,

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST[illegible]T, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Compa[illegible] Main Street, San Francisco.

Office, 116 Davis [illegible]et.

Cal State Library Jul 1 '93

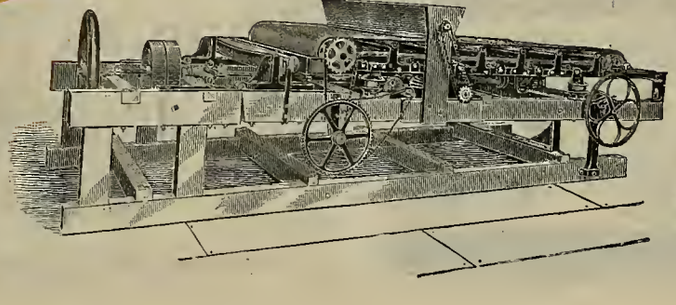
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1895.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Coast Industrial Notes, 415. The Secor System of Propulsion; The Railroad Kidney Weights of Sheet Metal; "Face-Hardened" Armor; Notices of Recent Patents, 418.

NEXT Thursday the Ship of State completes her 119th annual voyage, and rounds proudly into port with not a stripe torn nor a star missing. There is some hilge-water in the hold, and some of the machinery is defective; the rigging needs fixing up, and some of the crew are ohstreperous; yet the vessel is sound, and, rightly manned, is good for at least as many more years as have elapsed since the 56 men at Philadelphia gave her her charter papers in 1776.

SOME weeks ago it was stated in these columns that the habit of talking "hard times" (for it is only a hahit) had ceased to he fashionahle iu the East, where people had tired of it as they tire of mauy other things. In the last thirty days Coast residents have also evidently deemed it undesirable and unnecessary to keep on saying times are "hard," and there being an informal agreement to quit so asserting makes it more satisfactory all round. "There is nothing good or bad in life but thinking makes it so," and if we all cease thinking and saying that times are "hard," a great deal will have been done to dissipate distress.

THE Manufacturers' and Producers' Association is doing splendid work. The committee on lumher products need to iuquire into such cases as that of C. A. Hooper & Co., who have ordered 300 M. feet of lumher from Chicago for their new huilding. Another Chicago firm has a contract to furnish 1000 M. feet lumber to the huilders of the new parliament building at Victoria, B. C. This in the face of the fact that in all requiremeuts of size, quality, susceptibility of fine finish, price and everything that goes to make up superiority, this coast can furnish lumber for any purpose better and cheaper than it can be imported.

IN the Witwatersrandt, South Africa, gold mines are employed great numhers of natives at extremely low wages, the miserable shilling a day heiug the basis upon which these properties are made paying or speculative. Partly ou that foundation appears to rest the ability of the Randt mines to keep alive. The sixth annual report of the Witwatersrandt Chamber of Mines, to hand, gives some interesting facts regarding those "miners." The compilers of this report anounce with regret the frightful prevalence of drunkenness, and deplores the great frequency of terrible underground accidents which are rarely reported. Drunken Kaffirs swarm in the mines, incapable of lookiug out for themselves or their companions, and violent crimes, tribal fights and general havoc form a part of the daily doings therein. The white man is blamed for giving whisky to the Kaffir, and warned that self-interest requires a supervision of "the liquor traffic" in that part of South Africa.

WITH universal surprise and regret it is learned that Prof. Geo. Davidson has been removed from his official position. For half a century Prof. Davidson has been prominent as head of the Coast Geodetic Survey, and is recognized in Europe and America as foremost in geodesy, geology and astronomy. Viewed solely from a commercial aspect, aside from his scientific services and attainments, Prof. Davidson has been worth a great deal to this coast and to the nation he so faithfully and efficiently served for fifty years. To give the merest outline of his services and achievements would fill this page. He is now dropped by a Washington official who is either ignorant or careless of the needs of the service, or of the ordinary consideration due to such men as Prof. Davidson. The plea is "economy." Meauwhile the Professor's assistant is given the positiou at the same salary. The PRESS, in common with the thousands who realize his splendid services, feels that injustice has been done. Of him it cannot be said, "Superfluous lags the veteran on the stage." In the zenith of his fame, without one charge ever preferred against him, the acknowledged leading authority in his specialties, with iutellect undimmed and energies unimpaired, Prof. Davidson can get on vastly better without the Government position than the Government can without him. Prominent among the multitude of hlunders the preseut Administration is making, is the retirement of the man who more than any other helped to create the organization that he so worthily headed.

L. RECARD, of Calaveras, has patented and is now having huilt at Altaville a machine which is intended to revolutionize present methods of tunneling. He claims that it will "saw out a tunnel" at the rate of twenty-three feet a day, which, if practicable, will materially reduce the cost of drift work. The suhject is of interest to every miner, and if Mr. Recard can give practical and satisfactory showing of his machine he has as good a thing for himself and the mining world as has been evolved for some time. The machine is described as heing 12 feet long, 4 feet wide and 6 feet high, and with the 14 H. P. engine which runs it, weighs 6300 pounds. The principle is that of a circular saw, 60 drill points attached to each of two wheels, 4 feet high and 8 inches in diameter make 600 revolutions per minute: each point one-half an inch apart, every revolution feeding one-eighth of an inch. The inventor says it will cut twenty feet of a 6x8 tunnel in a day in the hardest rock at the cost of $1 per foot. The machine costs $1000, and requires three men to run it. The rock is crushed as fine as wheat grains, carried to the rear and dumped in a car. The drill points weigh one-quarter of a pound each, last four days, and are kept cool by a steady stream of water. While all things are possible, and it would be unfair aud premature to attempt discussion of a project yet in emhryo, it is to be said that some of the inventor's calculations seem difficult of practical fulfillment.

THE PRESS has had considerahle to say ahout the coming industrial exposition of the Mechanics' Institute of this city, and takes pleasure in further reference to the innovation proposed regarding the manner of judging exhibits and making awards. The method hitherto adopted has heen unsatisfactory iu its practical result. It was evident that if displays for competition and award were to be secured some better scheme of judgment must he assured. The committee in charge have an excellent plan, which, in brief, is to have a standard, represented by 100, each judge, acting independently of the other judges, to indicate his opinion of the exhibit as to efficiency, design, workmanship and display hy marking as near or far from 100 as judgment dictates, the aggregate divided hy the number of judges being the average, and the competitor receiving the highest average to have the award. Competent judges and unprejudiced examiners can, under this plan, with intelligent discrimination, make a just award, which will be more highly valued by its recipient than if assumed to be affected by any element of personal bias. The standard of comparison is to be "the present state-of-the-art, as the judge knows it," and, of course, upon the competency of the judges will depend the justice of the result.

Stamp Mill Methods.

A Colorado contemporary, which usually knows what it is talking ahout, hrings up the old subject of California and Colorado stamp mills, and says it "is proven, or claimed to be proven, that the slow Colorado method will save more of the gold in the ore than the rapid California method," and also says that "the halance of authority seems to he in favor of the claim that the slow method saves the highest percentage of value." It is not "proven" that "the slow Colorado method" is more efficient, nor does any "balance" of competent "authority" favor the Colorado claim. Out of all the discussion that has taken place with more justice could be claimed for the California method all that the Colorado journal credits to the Colorado method; but, even if it were a question of rivalry or competitive merit, it would he invidious to assume that a question is settled because discussed or superiority conceded because claimed. In all the talk about stamps and the relative merits of the California and Colorado mill, it must be remembered that the main question is the release of gold from the ore, and that there are other appliances than stamps. The whole thing is a question of suiting the ore to the process rather than suiting the process to the ore. Following the advice of Paul (not A. B., but his illustrious predecessor the Saint) to prove all things and hold fast to that which is good, the California miner and maker of mining machinery found that, so far as stamp mills are concerned, "the California method" is hest adapted to California ore; probahly the Colorado miner on the same general lines of practical effort may have equally as good an opinion of "the Colorado method" for Colorado ore. Our Colorado contemporary argues further that the higher the grade of the ore the greater the saving in the use of "the Colorado method." This is only a mere assertion, unsupported by statistics or specified instance, and, as such, is unworthy reply. The point is here: Most of our California ore has hut a small proportion of sulphurets—from one-quarter of one to six per cent—these sulphurets being rich in gold. In Colorado, as a rule, the percentage of sulphurets is a great deal higher, and the yield much less. Consequently the two ores require different methods. The old way was to crush coarse in the hattery and grind in the pans. The evolution of the California stamp mill has produced a modern method that gives superior and satisfactory results. It is helieved by many that the Colorado mill sacrifices some of the conditions necessary to the hest crushing in an effort to secure amalgamation, and that the Colorado mill is more of an amalgamating machine. Men whose lives have heen devoted to making or using stamp mills say that the chief requiremeut is to hreak the gangue so that hoth the fine and coarse gold shall come from under the stamps with as little change as possihle in form or condition. Apart from chemical change, there is often considerahle loss from the change in form that the gold undergoes in stamping. Some authorities go so far as to maintain that ore should be cracked, and not crushed, and while this may seem radical to upholders or defenders of "the Colorado method," yet it is not wholly indefensible. As between very coarse and very fine crushing it is believed the advantage lies with the former.

The gold ore of this State, in general, is harder than that in Colorado, the gold therein coarser and the ore hodies larger. Methods therefore vary, and while the California method might produce satisfactory results in Gilpin county, yet it is helieved that a Gilpin county mill would he a failure here judged by financial results. The question is not one of scientific metallurgy, hut money outcome. While the method favored by our Colorado contemporary may produce more hullion at a greater cost, the method most favored here in stamp mill operation produces hullion of greater value at less cost.

There is a contrast and will be, but while we commend the Colorado journal in standing up for Colorado methods which have proved satisfactory in Colorado, we think it should modify its sweeping claims to general superiority, which are unfounded and untenahle.

Concentrates.

THE Centeanial-Eureka (Utau) monthly dividend of $30,000 makes a total of $1,140,000.

A WASHINGTON STATE MINERS' ASSOCIATION is to be organized next week at Spokane.

THE Harqua Hala, Arizona, mine, recently shut down, has resumed work on a small scale.

ARIZONA'S new mining law, a digest of which was recently published, goes into effect next Monday.

THE Banner group of mining claims, adjoining the Gold Cross mine, has been bonded to J. M. Day.

THE Keystone Tunnel and Mining Company of Raton, N. M., has incorporated; capital stock, $1,000,000.

THE De Lamar, Nevada, Gold Mining Co. have their mill running continuously, and ship $30,000 per week.

SUPERINTENDENT WOOD reports that the Camas No. 2, Idaho, mine yielded a net profit of $12,000 in May.

THE Mount Reuben Mining Co. has incorporated in Portland, Or., to operate in Josephine Co.; capital stock $60,000.

THE Omaha Mining Co. has declared a dividend, No. 32, of 15 cents a share, payable immediately in San Francisco.

THE $6 rate on ore from Idaho to Salt Lake has been restored, to the great satisfaction of the Wood River people.

THE American Mining Convention will assemble in Atlanta, Georgia, during the Exposition, on the first week in October.

THE Grass Valley Miners' Union picnic netted $115.50, which has been donated to the California State Miners' Association.

THE Oricut Placer Gold Mining Company of Nevada county has levied an assessment of 50 cents a share, delinquent July 20th.

THE Bullion-Beck and Champion (Utah) Mining Co. last Tuesday declared a dividend aggregating $100,000, payable to-day.

A CONTRACT is to be let to sink a shaft 100 feet and drive a tunnel 100 feet on the Drum Lummon lode on Douglas Island, Alaska.

A REDDING paper says Leivsay and Bystle sold a claim near Shasta to a San Francisco man for $2000. The official record says $360.

AT the Uncle Sam mine, near Kennett, Shasta Co., nearly eighty men are working on rock and shipping about $20,000 per month.

W. J. SCHOFIELD and L. GREEN have bonded the Union Hill, Nevada Co., and will work some of the refractory ore in a Crawford mill.

THE Dayton dredge is finding large quantities of amalgam and sulphurets. It is expected that the company will soon be declaring dividends.

RETURNS from the Black Bear mine indicate that, if continuous, Superintendent of the Mint Daggett will be well up in the financial world.

THE Butte Basin, Amador, Gravel Mine is reported sold in this city, the new owners proposing to tunnel 1000 feet from the Mokelumne river side.

A CLEAN-UP is reported from the Cariboo Hydraulic Company's mine, Cariboo, of 66 pounds 3 ounces of gold, it representing 172 hours' washing.

NEARLY 100 four-horse teams are on the road hauling ore between Rossland and Northport, B. C. There are fully 500 prospectors in the vicinity.

THE *Miner* says: "Bodie is the liveliest mining town on the coast to-day," but as usual in such cases, adds that no one should go there looking for work.

DESPITE the depression in silver, Calico, San Bernardino county, sends out 1000 ounces of silver bullion daily. The Silver King 30-stamp mill is working continuously.

T. J. MCCUNE has a contract to furnish Anaconda, Montana, smelters with 300,000 cords of wood at $3.44 per cord. He has built a 40-mile flume to bring the wood from the east side of the Rockies.

JOHN TIMMINS, editor of the *Searchlight*, a Juneau, Alaska, paper, has been sentenced to six years' imprisonment for attempting to murder Frank Howard, editor of the *Mining Record*, a rival paper.

W. S. BENNETT has refused $100,000 for his Siskiyou Co. placer mine, offered him by a San Franciscan, but is reported to favorably entertain a subsequent offer of $125,000—half cash, the remainder in six months.

THE proprietors of the Golden Cross mine at Ogilby, San Diego county, say they have ore enough in sight to keep a hundred stamps dropping for a year. Nearly 400 M. feet of timber were used in the recent 60-stamp addition to the mill.

THE twelve years litigation over the New Almaden quicksilver mine was ended by Judge McKenna this week who decided against the Gray heirs; that the company's title was good, and that the plaintiffs had no legal claims to the property.

"$27 TO THE CUBIC YARD" is what is now reported from Temple Bar on the Colorado. Forty dry washers are reported about to be put in a mile from the river. As the weather grows cooler these statements will probably contract a little.

THE Sather bank contemplates operating the Stonewall mine, San Diego Co., or disposing of it to an English company. It was recently exported by an Eastern gentleman named Miller, who got $4000 for his report, which is now in London.

R. B. HARPER and Alfred Williams have sold to an English syndicate the Dos Amigo and Eureka mines, Moris district, Chihuahua, Mexico, for a reported sum of £50,000. A 50-stamp mill will be built. R. B. Harper will be manager for the new company.

G. W. ENGLISH, a well-known miner, lost his life at the Calico, San Bernardino, mine last Wednesday. He was trying to clean out a chute which had become gorged with ore, when it burst, covering and smothering him before assistance could be procured.

THE Queen Bee mine, near St. Louis, in Jefferson county, Mont., is sold to Omaha parties for $100,000. The mine has a twenty-four-foot vein of gold quartz, running from $16 to $40 a ton. The sale also includes the Gold Coin, the adjoining claim. A mill will be put up to work the ore from the fifty-foot level up. When the next fifty feet of depth is obtained, a concentrator will be erected.

THE Boundary Creek Mining Company is incorporated in Spokane, Wash., capital stock $1,000,000; to develop the Last Chance mine, Yale district, Boundary Creek. It is a gold and silver proposition and the incorporators are preparing to put in extensive machinery.

ACCORDING to the Sonora *Democrat* the Merced Mining Company of Coulterville has laid off a piece of ground near its properties which is to be sold to married men alone, in ten-dollar assessments. A qualification is marriage. Single men are not entitled to the land at all.

THE new Colorado owners of the Douglas, Brown, Grassi and Pedrassi mines in Silver Star district, Esmeralda Co., Nev.—Senator Wolcott and associates—take possession this week. They are credited with an intention to spend $300,000 in development work and machinery.

MESSRS. Richards and Bragdon tell the Sonora *Democrat* that, at Coulterville, "the Boston and Montana Company will spend one and one-half millions of dollars in development work. The company will, inside of a year, put up a 400-stamp mill." That's a good many stamps!

THE Comet mine, Nevada Co., is bonded to A. W. Stoddart. It has produced some good milling quartz. The lowest depth is two hundred feet. Machinery will be purchased and development work begun. The Gold Flat Mine, near Nevada City, has been bonded to F. C. Beckwith and G. A. Treadwell.

A COLORADO contemporary suggests the formation of an American Society of prospectors. The idea is a good one. It would be somewhat difficult, however, to keep up the honorary membership of the organization, and the real prospector is so eternally on the go that his postoffice address is sometimes a matter of uncertainty.

WHILE recently in San Francisco Allan Smith bought a five-stamp mill, a waster, fans, settlers and other machinery for his Batuc mine, 130 miles northeast of Hermosillo, Sonora, Mexico. He also secured a smelter from the Canizal Mining Co., to run on ore from the Suiqui and Batuc mines. The silver bullion is coined into Mexican dollars.

AT Jerome, Arizona, last Saturday, the premature explosion of a blast in the United Verde Copper Mine tore to pieces a miner named Henry Wilman. He had just finished loading two holes and was preparing to shoot them off. He lighted the first fuse and an explosion followed almost instantly. Defective fuse is believed to have been the cause.

NO SURER indication is observed of the general livening up in mining matters than the appearance of new papers. The Coulterville, Mariposa Co., *Miner* is the latest. Another noticeable feature is the fact that in nearly every case the word "Miner" is chosen as the name of the paper. The only exception in mind at the moment is the *Leader* of Sierra City.

THE Nelson, B. C., *Miner*, a conservative journal, gently raps the knuckles of some of its contemporaries and says "a newspaper in a mining country has no right to make unauthorized statements." Just so. The *Miner* seems to claim the right, however, to reprove its British Columbia rivals for taking matter without credit while constantly doing the same thing itself!

OPERATIONS have practically ceased at the Derbec drift mine, near North Bloomfield, Nevada county, which has been worked continually since 1877. The eight miles of channel averaged 450 feet in width. The ground yield varied from 70 cents to $9, averaging $2.50. The average value of the gold was $18.50 per ounce. For many years the semi-monthly clean-up was over $7,000.

THE big Peralta-Reavis claim to 12,000,000 acres in Arizona and New Mexico has collapsed. Reavis is in prison, and his eminent attorneys, Col. Ingersoll and Col. Broadhead, have abandoned the case. Reavis swore on the witness-stand that the original company organized to push the fraudulent claim had given him $65,000, the S. P. Co. $50,000, and that he had practically blackmailed the Silver King Mining Co. out of $25,000.

THE last monthly report of the Alaska-Treadwell mine on Douglas Island, Alaska, shows 25,991 tons of ore and 398 tons sulphurets worked, the latter yielding $28,873. The total bullion product for the month was $87,697, the expenses were $22,946. The Alaska-Mexican mine close by yielded $17,733 from 233 tons ore and 135 tons sulphurets during the same month, the ore averaging $2.38 per ton. The expenses for the month were $10,485.

THIRTEEN Comstock miners, who left Virginia, Nev., last April to take proffered positions in the Candelaria mine, Durango, Mexico, are returning slowly. They each paid the fare, $43.50, worked a month, got $15 each, found their baggage would be held for their board, and concluded they had enough of it. Their employers' contract to run a tunnel at $8 per foot included powder and fuse and left little for labor.

CONSIDERABLE interest is reported in a discovery on Kosk Creek, 60 miles northeast of Redding. The quartz is reported to carry iron and copper and assay $50 in gold per ton, the outcroppings of the ledge being traced for nearly two miles along the creek. This is the essence of half a column wired from Redding, and is to be taken with a very large grain of salt. It is doubtful if a reliable assay has yet been made and still more doubtful that it will "average" $50.

A RECENT Washington mineral land decision is: "An amended survey and republication will be required where it is found that the land embraced within the application, as set forth in the official survey and published notice, is incorrectly described. Preliminary proof for mineral patent must show the claim valid at application. A mineral notice must give the course and length of a line connecting the claim with a corner of the public surveys with a mineral monument."

THE Pacific Iron Works, in liquidation, is about to foreclose a mortgage of $8695.76 on the Amador Queen Mining Company, in Hunt's gulch, Amador Co., given in 1889 for machinery furnished. A prior lien of miners and mechanics was placed against the property and pressed to a judgment, the property being bought by A. S. Cochrane, of London, England. The company sold and assigned the right of redemption to W. N. Bardue, who subsequently redeemed from Cochrane.

THE following is from the Amador *Republican*: "C. E. Purington is up from San Francisco on the Gover mine business. He has been negotiating the sale of property for some time, and now says positively that the mine is sold. His trip this time is to try and make some arrangements with the numerous creditors, by which the payment of their claims may be deferred. In other words, the proposition is to pay them out of the proceeds of the mine, instead of out of the pockets of the purchasers."

BIG gold nugget finds are so scarce that an Arizona genius deems the time propitious to wire from Hackberry a circumstantial statement of the discovery of a silver nugget, or, rather, a boulder which "weighs about half a ton." He says it was found by W. Tucker and J. Doyle, June 15, 300 feet from the railroad track, four miles from Pench Springs, and is worth from $8,000 to $10,000. The finders are naturally alleged to have located a mining claim where the boulder was found, "to search for the main vein."

JUDGE JENKINS has authorized the Northern Pacific receivers to enter into a contract with the Parrott Silver & Copper Mining Company, whereby the mining company is to build four miles of track at a cost of $63,000, from White Hall, in Montana. The mining company is to erect a smelter and agrees to furnished all the money to build the track, but the receivers are expected to pay it back. This is done by allowing the mining company fifty per cent of the freight charges on material to the smelter on account, and fifty per cent on ore hauled until the amount is paid up.

A DISPATCH from Wardner Idaho, reports great rejoicing over the resumption of work in the Bunker Hill and Sullivan mill and mines. Manager Bradley has put sixty-three men at work, and has applications for work from fifty more. When the properties are in full blast they will give direct employment to 350 men; indirectly, to fifty more. Work was started without a sign of trouble from the Miners' Union. There was no interference of any kind, and no attempt even was made at moral suasion. The feeling in that section is that everything depends upon the action of the union. If the union does not interfere forcibly there will be no trouble; if it does, there is a probability of warfare.

THE Horsefly Gold Mining Company on the Horsefly River, Cariboo, B. C., a distinct concern from the Horsefly Hydraulic Mining Company, has received 250 tons of pipe from this city to use on its 360 acres of placer ground. Its claim is 2640x5940 feet with an average depth of over 50 feet, located on an ancient channel. Thirty shafts have been put down to bedrock from 30 to 150 feet in depth, and numerous tunnels and crosscuts run in different directions to prospect the ground, in all of which gold is found in paying quantities. The company, which is incorporated under the laws of this State with one million dollars capital, proposes to bring in 2000 inches of water through a ditch and pipe line six miles in length. Over $100,000 has been expended in sinking, prospecting, etc.

T. H. LEGGETT, president and general manager of the Bodie Standard Mining Company, who has resigned to accept the position of consulting expert in Johannesburg, South Africa, for a London mining corporation, will leave about the 15th prox. His successor is R. G. Brown, who has been for the past five years in charge of the Clark group of mines at Butte, Montana. It is with considerable regret, says the *Miner*, that the people of Bodie have to see such a progressive and enterprising man as Mr. Leggett take his departure. He introduced a system of electrical transmission of power and of the utilization of tailings which has given a new lease of life to that place, and shown that under proper management the mines can be made to pay.

TWO REQUESTS are received for gold statistics from Mashonaland, South Africa. The British South Africa Company has sent a most elaborate report, but no aggregate is given of the output. In the six districts of Mashonaland, from the inception of mining operations to Aug. 31st, '94, there were registered 44,325 claims. Of these, to that date, 13,880 had been abandoned and 8,076 forfeited. In his report on that country last November, Mr. Hammond says millions of pounds sterling worth of gold have been taken from the ancient mines there, and "considers the prospects of the country encouraging." It is 1690 miles from Cape Town to Salisbury, and the report says, "Parties not pressed for time, who have much baggage, will find it considerably cheaper to travel by ox-waggon."

THE Debris Commission desires it distinctly understood that the provisions under which it operates are mandatory. This will receive the indorsement of every hydraulic miner who realizes how much the industry depends upon compliance with the provisions of the law under which operations are carried on. The Commission announces its intention to prosecute in the Federal courts in such cases as that of L. V. Teft, of Plumas Co., who is alleged to have disregarded the instructions of the Commission and operated his mine in violation of such official instructions. The maximum penalty in such cases is $5000 fine, or one year's imprisonment, or both. The justice or equity of all this is not under present consideration. It is the law and the Commission that has authority in the matter say the law must be observed, and those violating it will be prosecuted in the Federal courts.

S. C. SMITH, who is managing a mining property in the Philippine Islands, lying at the east of the China sea, between Borneo and Formosa, writes from Largos: "As a mining country I have never seen its equal, there is gold everywhere. The little streams are full of placer gold and the mountains a perfect network of small ledges, some of them running as much as from four to six ounces per ton, but the people are at least one thousand years behind the times; no work has yet been done here in a systematic manner, and for several reasons it is almost impossible to prospect here. The government does not give the proper protection to justify any man spending his time prospecting. Another reason is the interior of the islands, which in my opinion is the richest portion of them, are peopled with wild tribes of Indians that are about as ferocious as wild beasts, and no prospecting could be done in their territory, unless the prospectors went in in large parties; and another reason is that the foliage, which is a regular jungle, is so thick that a man cannot get through it. If any other nation on earth, except the Spaniards, had this country, it would very soon be the largest gold producing country in the world, but everything is so handicapped that it is impossible to get capital to come in here and it will take capital to make a success of it. The ore is all high grade but I am a little afraid it cannot all be successfully worked by the free milling process. I have all the machinery on hand for a ten-stamp mill, and if it is a success the company will at once increase their works. They have any amount of ore, and in this country of cheap labor they are bound to receive large profits."

The Lixiviation of Silver Ores by the Russell Process at Aspen, Colorado.*

By WILLARD S. MORSE, Prescott, Arizona.

The purpose of this paper is to record the results obtained in the use of the Russell process at Aspen, Colo., covering a period of fourteen months, from November, 1891, to December, 1892, during which time over 30,000 tons of ore, purchased outright, on sample and assay, were treated. No explanatiou of results will he attempted, nor will the chemistry of the process be discussed.

The plant was designed by C. A. Stetefeldt, of San Francisco, and built by the owners hy day labor. The entire plant is run by water power, supplied hy a flume 3600 feet long, and a pipe line 2200 feet long, with a head of 170 feet. A Peltou water wheel, eight feet in diameter, is used, from which power is transmitted hy wire rope to the main counter-shaft in the mill, a distance of about 250 feet. From the mill to the sampling works, about 150 feet, power is also transmitted by a wire rope.

A Pelton water wheel, three feet in diameter, supplies power to the dynamo for lighting the plant.

The works are located adjoining the Santa Fe railroad tracks, and all ore and supplies are unloaded directly from the cars to the works.

The sampling works are provided with crushers and rolls, the latter being used only on samples, and not on the entire ore. The Cornish hand-quartering method is used in sampling ore for purchase. After crushing and sampling, the ore goes to the bedding-floor, where it is made up into mixtures suitable for the mill.

The drying plant consists of four Stetefeldt douhle shelf-dryers, six shelves high, and provided with dust-chambers and a stack 65 feet high for draft. These dryers are fired with gas from Taylor gas-producers, a description of which, together with the results obtained, was given in a paper by the writer, read at the Montreal meeting, February, 1893, and to which reference is made for details omitted in this paper.

The crushing plant consists of thirty 850-pound stamps, dropping ninety-two times per minute, with douhle discharge mortars for crushing ore, and ten 650-pound stamps for crushing salt.

The chloridizing roasting is done in a Stetefeldt furnace, provided with very complete dust chambers, and a stack 165 feet high for draft. The furnace is likewise fired with producer-gas, and the results will be found in the paper referred to above.

A cooling floor, 100 hy 125 feet, is used for cooling the ore after roasting.

The leaching department is provided with seven leaching or ore tanks, 17 feet inside diameter and 9 feet deep; six precipitating tanks for solution, 12 feet in diameter and 9 feet deep; six precipitatiug tanks for wash-water, 8 feet in diameter and 10 feet deep; four storage tanks for solution, 12 feet in diameter and 8 feet deep; and two tanks for the storage of sulphides, 10 feet in diameter and 3 feet deep.

A Johnson filter-press, operated hy compressed air, and a steam dryer, are used for pressing and drying sulphides.

Two Knowles air compressors furnish compressed air for elevating solutions, stirring solutions during precipitation, and pressing sulphides.

Two boilers, 54 inches by 14 feet, supply steam for heating the mill and solutions, and for drying sulphides.

The following is an explanation of the terms used in this paper:

"Battery sample"—the sample of ore after crushing, taken every half hour and assayed daily.

"Top sample"—the sample of ore and salt mixed, taken every half hour at the top of the furnace, and assayed daily and solubility determined.

"Furnace sample"—the samples of roasted ore taken as the ore is drawn from the furnace, and taken from the shaft of the furnace, the return flue, and the dust chambers.

"Charge sample"—the sample of roasted ore takeu when the ore is charged to the leaching tanks.

"Washed ore sample"—the sample taken from the leaching-tanks after the ore has heen leached with water and the soluhle salts have been removed.

"Chlorination"—the amount or percentage of silver that can be extracted in the laboratory by leaching with hyposulphite of soda.

"Extraction"—the amount or percentage of silver that can he extracted in the lahoratory by the Russell process.

"Solubility"—the percentage of soluble salts that can be removed in the laboratory hy leaching with water.

"Ordinary solution"—a solution of ahout two per cent of hyposulphite of soda.

"Extra solution"—the cuprous hyposulphite of the Russell process.

ORES TREATED.

The ores treated were principally from the Aspen district, and the following is the average composition, calculated from analyses made on each of nearly one thousand lots of ore:

	Ounces per ton.
Silver	27.918
	Per cent.
Lead	2.277
Silica	21.663
Barite	20.924
Lime	10.992
Magnesia	4.245
Iron	10.025
Zinc	2.854
Copper	0.161
Sulphur	8.105

The extremes of each are given below, from the analyses on lots of ore of about 30 tons each. The maximum for each is printed in heavy type, and the other figures in the same horizontal lines show the percentage of the other ingredients accompanying the said maximum.

The total ore treated during the period was 30,856.9445 tons (dry), assaying 27.9188 ounces of silver per ton and containing 861,488.05 ounces of silver. The value was ascertained hy sampling and assaying, and was the amount paid for. It was checked hy battery weights and daily samples, which showed an average of 27.9806 ounces of silver per ton; also by hattery weights and calculated value of top samples made daily, which showed an average of 27.9 ounces of silver per ton.

Extreme of	Ph.	SiO_2.	$BaSO_4$.	CaO.	MgO.	Fe.	Zn.	Cu.	S, as Sulphide
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*

Of the 30,857 tous treated, 19,191 tons were sampled by the Taylor & Brunton sampling works, using Brunton's patent automatic sampler, which "checked" with the mill-sampling hy hand-quartering within 0.12 ounce of silver per ton.

DUST LOSS AND LOSS BY VOLATILIZATION IN ROASTING.

	Tons.	*Silver Assay. Value per ton.*	*Total Contents of Silver, Ounces.*
Raw ore	30,857	27.9188	861,488.05
Roasted ore	31,775	24.6289	782,586 09
Loss of silver in ounces			78,901.96

Or 9.157 per cent of the total contents.

The ahove loss iucludes mechanical or dust loss in sampling, drying, crushing, roasting, handling on cooling floor and charging to leaching vats. Just what proportion of this loss is chargeable to these causes it is hard to determine, hut I question if it exceeds 1 per cent. The mill is provided with every appliance for preventing loss from these sources. The dust loss in drying is reduced to a minimum by the use of shelf dryers; the hatteries are provided with a suction fan which forces the dust into a settling chamber, and the dust chambers of the Stetefeldt furnace seem to do the work for which they were designed, as the last compartment contained more fume than dust. It is possible that I underestimate the dust loss, hut I think not, when the fact is taken into consideration that samples of dust, taken at various times from the timbers of the mill, never exceeded two-thirds of the assay value of the ore, and the dust caught in the dust chambers of the Stetefeldt furnace showed an average assay value of 18 ounces, against the average of 27 ounces of silver per ton from the shaft of the furnace.

I presume my figures will be criticized hy Mr. Stetefeldt, who, I believe, has always claimed that the loss of silver hy volatilization in roasting in the Stetefeldt furnace must necessarily be low, on account of the short exposure of the ore to a high heat; hut I have never seen any figures from actual experience to prove this assertion.

Great care was taken to find out exactly what this loss was. For ahout three-quarters of the time every pound of the roasted ore was weighed while heing charged to the leaching tanks, and during the rest of the time the weight of the roasted ore was estimated hy volume, based on the experience gained by actual weighing. The results checked closely with the period when the ore was actually weighed. A further confirmation of the correctness of the figures given is found in the results of a later run of about 8000 tons of ore, where all the roasted ore was weighed, and the loss showed over 10 per cent.

ROASTING AND CHLORIDIZING.

The ore was roasted with 12.2 per cent of its weight of salt, or 244.4 pounds per ton of ore.

Furnace-Samples.—Two daily determinatious were made hy taking a sample from each car of roasted ore as drawn from the shaft, return flue and dust chambers of the Stetefeldt furnace. The proportion of ore taken from each was noted, and assay, solubility, chlorination and extraction tests were made on each sample. Again, when the ore was charged into the leaching vats another sample was taken, and the same determinations were made, and the increase in chlorination and extraction by lying on the cooling floor was calculated.

From the data thus obtained the following averages have been calculated:

	Results when Drawn from Furnace.				
	Proportion of entire ore, per cent.	Ounces silver per ton.	Solubility, per cent.	Chlorination, per cent.	Extraction, per cent.
Shaft of furnace	53.1314	27.7783	15.4524	43.5355	70.4077
Return flue	33.0409	25.0434	10.3801	59.1006	83.8121
Dust chamher	13.8247	18.3307	17.2105	64.1864	69.8810
General average	100.	25.4478	13.5072	52.5102	78.4358

After lyiug on the cooling floor for an average of 102 hours, the ore showed the following results:

Ounces silver per ton.	Solubility. *Per cent.*	Chlorination. *Per cent.*	Extraction. *Per cent.*
24.6289	14.0830	78.9882	89.7857

Differeuce in results hy laying on cooling floor:

	Per cent.
Gain in chlorination	26.4180
Gain in extraction	11.3499

LEACHING OF ORE AND EXTRACTION IN MILL.

The weight of the roasted ore treated was 31,775.338 tons, which was leached in 546 charges, averaging 58.19 tons. Each charge required about 22.5 cubic feet of water, or ahout 60 inches in depth in the tank, to completely saturate it. After washing and removing soluable salts, ahout 50 inches of solution will saturate the charge.

The following method of leaching was followed, as a rule:

1. The ore was charged into one volume of water, followed hy a second volume of wash-water, and by:
2. Three volumes of warm ordinary solution (about 1.8 per cent of hydrosulphite);
3. One volume of extra-solution (average ahout 0.5 per cent of $CuSO_4$);
4. One volume of warm ordinary solution;
5. One volume of extra-solution;
6. Two volumes of warm ordinary solution; and
7. The last wash-water, the dividing liue between solution and wash-water heing drawn wheu ahout one and one-fourth volumes of wash-water had heeu applied.

This treatment was varied as to quantity of solution applied and strength of extra solution, but the ahove is ahout an average. The averagc time of leachiug each charge was about 100 hours. This includes stops of every kind.

The average leaching rate was thirteen inches per hour. This was the natural leaching ratc; hut, as a rule, iu leaching after the ore had been washed, the leaching rate was cut down to ten inches per hour.

The following method of sampling the ore in the vats was used for all samples except the final tailings sample. A brass tube with a valve in the hottom was used, and three to five cores one and one-fourth inches in diameter for the entire depth of the charge were secured. For the final tailings sample the following method was used: After one-half of the charge had been sluiced, and a face of tailings ahout seven feet high and seventeen feet across thus secured, three samples were taken as follows: Top sample, taken ahout one foot from surface of ore and across entire face; bottom sample, taken in same way ahout oue foot from the bottom of the vat; and general sample, taken over the entire face and representing a general average of the tailings.

In addition to the intermediate samples, the following samples were always taken: Washed ore sample, taken after washing ore with water, on which chlorination and extractiou tests were made, as well as assay; first ordinary sample, taken after the ore had heen leached with ordinary solution, and on which the extraction in mill by hyposulphite is calculated; preliminary sample, taken before sluicing the tailings; and the *top*, *bottom* and *general tailings samples*, already described.

On the general tailings samples the conteuts of the tailings are calculated.

The average of these samples for the run are as follows:

	Ounces Silver per ton.
Washed ore samples	24.4905
First ordinary	11.8174
Preliminary tailings	3.44
Top tailings	4.04
Bottom tailings	4.86
General tailings	3.7984

The following are the assays and laboratory determinations made on samples, and the calculations based thereon:

Charge samples, taken	Silver per ton	24.6289 ounces.
	Soluble salts	14.083 per cent.
	Calculated value (after deducting soluble salts)	28.6648 ounces.
	Chlorination	78.9882 per cent.
	Extraction	89.7857 "
Washed ore samples	Silver per ton	24.4905 ounces.
	Showing an extraction of silver in roasted ore by washing with water of	14.5616 per cent.
	Chlorination	64.3261 "
	Extraction	88.5743 "
First ordinary	Silver per ton	11.8174 ounces.
	Showing an extraction of silver in roasted ore by leaching with hyposulphite of soda of	58.7738 per cent.
Final tailings	Silver per ton	3.7984 ounces.
	Showing an extraction of silver in roasted ore by all treatment of	86.7485 per cent.

* Read at the Florida meeting, March, '95, of the American Institute of Mining Engineers.

CALCULATION OF SILVER IN TAILINGS.

Weight of roasted ore	31,775.338	tons.
Soluble salts	14.083	per cent.
Weight of tailings	27,310.410	tons.
Average assay of tailings	3.7984	ounces.
Contents of tailings	103,702.36	ounces of silver.

From the above the following calculations are made:

Decrease in laboratory results by washing:		
Chlorination	14.6021	per cent.
Extraction	1.2114	"

RESULTS IN LABORATORY COMPARED WITH RESULTS IN MILL.

	Per cent.		Per cent.
Laboratory results on charge samples:	Chlorination, 78.9282	Extraction,	89.7857
Laboratory results on washed ore samples,	" 64.3261	"	88.5743
Mill results: Extracted by hyposulphite of soda	58.7738	By extra,	86,7485

MILL RESULTS BEHIND LABORATORY RESULTS.

	Per cent.		Per cent.
Based on charge samples, Chlorination,	20.1544	Extraction,	3.0372
Based on washed ore samples,	" 5.5523	"	1.8258

I will not undertake here to discuss the causes for the decrease in chlorination, or the changing of the silver chloride in roasted ore, to some other form which is not soluble in a solution of hyposulphite of soda, by the washing with cold water. A vast amount of experimenting was done during the year, and the conclusions arrived at may form the subject of another paper.

PRODUCT.

Silver was precipitated from solutions with sodium sulphide; part of the time with a polysulphide, Na_2S_2, made from caustic soda and sulphur, and part of the time with a monosulphide, Na_2S, imported from Germany in the form of crystals. The total of sulphides produced was 442,576 pounds, divided as follows:

	Pounds.	Ounces per ton.		Ounces of Silver.
Solution sulphides	313,417	Assaying, 3790	Containing,	593,069.12
Wash-water sulphides.	95,442	" 2875	"	136,535.66
Dead carbonates	33,717	" 432	"	7,698.84
Total contents of product				737,303.62

DIFFERENCE BETWEEN "APPARENT" AND "ACTUAL" EXTRACTION.

In noting the difference between the "apparent extraction" (*i. e.*, the extraction determined by calculating contents of tailings as against contents of roasted ore) and the "actual extraction" (*i. e.*, that determined by calculating contents of product as against contents of roasted ore), attention is called to the fact that the contents of sulphides are based on "corrected assays," that is to say, the silver contents of scorification slag and cupel are added to the original assay. This addition was found, on this grade of sulphides, to amount to about two per cent. The ore contents are figured on the commercial assay by scorification, in which no account is made of silver contained in slag and cupel, the amount of which was found to be, on this ore, from 4 to 5 per cent.

APPARENT EXTRACTION.

	Ounces of Silver.
Contents of roasted ore	782,586.09
Contents of tailings	103,702.36
Calculated contents of sulphides	678,883.73
(On this calculation the apparent extraction of 86.74 per cent of the silver in roasted ore is based.)	
Actual contents of sulphides by corrected assay	737,303.62
(On this calculation the actual extraction of 94.21 per cent of the silver in roasted ore is based.)	
Differences between calculated and actual contents of sulphides = 6.78 per cent, or	58,419,89

ACTUAL EXTRACTION.

	Ounces of Silver.
Contents of raw ore	861,488 05
Contents of roasted ore	782,586.09
Loss in roasting and dust loss (9.157 per cent)	78,901.96
Contents of product	737,303.62
Or 94.21+ per cent of the silver in roasted ore and 85.58+ per cent of the silver in raw ore.	

CONSUMPTION AND COST OF SALT, COAL AND CHEMICALS PER TON OF ORE TREATED.

	Used per ton of Ore. Pounds.	Cost per ton of Ore.
Salt	244.48	$0.8719
Coal for drying ore and salt	85.77	.1322
Coal for roasting ore	117.44	.1819
Bluestone	13.45	.6331
Hyposulphite of soda	9.98	.3740
Chemicals for precipitating silver, including caustic soda, sulphur and sodium sulphide	18.86	.6835

DISCUSSION.

C. A. STETEFELDT, Oakland, Cal.: It has always been assumed by the writer, and also by others, that the silver volatilized by roasting in a Stetefeldt furnace was a minimum as compared with roasting in other furnaces. Now, Mr. Morse records at Aspen a loss of 9 and even over 10 per cent. Without doubting in the least the accuracy of Mr. Morse's statistics, I wish to say that it is not safe to draw general conclusions from a limited experience.

Unfortunately, I have no array of statistical figures at my disposal to combat Mr. Morse's statement, if he means to apply it to the Stetefeldt furnace at large, but must confine myself to general arguments.

In the first place, where ores are mined and reduced by the same company, accurate statistics in regard to the dry weights of the raw and roasted ores are not kept. This, for example, is the case at the Ontario and Marsac mills, Park City, Utah. In *Trans.*, xiv., 341, I have recorded experiments establishing the comparative loss of silver in roasting Ontario ore in the Howell and Stetefeld furnaces. In one of these experiments the loss of silver was 13.5 per cent greater in the Howell than in the Stetefeldt furnace. Now, if the Stetefeldt furnace had lost ten per cent silver, the loss in the Howell furnace would have been 23.5 per cent, which is not probable. In following the argument in my paper quoted above, it will be seen that the loss in roasting can be determined approximately by an indirect method. In the chloridizing roasting of base ores a considerable change in weight takes place, *i. e.*, the roasted ore, minus soluble salts, weighs considerably less than the raw ore before roasting. In comparing the value of the raw ore with the calculated value of the roasted ore minus soluble salts, the latter value should be greater in proportion to the change in weight, provided silver has not been lost. This change in weight can be determined by roasting average samples of ore in the muffle. From numerous determinations made in this way it appeared that the loss of silver by roasting Ontario ore in the Stetefeldt furnace would not exceed from two to three per cent.

Several mills using the Stetefeldt furnace have done custom work, namely, the Reno mill and the Manhattan mill, in Nevada, and the Lexington mill in Montana. Although I have no statistics from these mills at my disposal to prove my case, the following general argument will, nevertheless, have some weight:

The Reno mill did custom work exclusively, the Nevada Land and Mining Company having no mines of its own, and the business was very profitable while the supply of ore lasted. No complaint ever reached me as to extravagant loss of silver in roasting. Mr. Ottokar Hofmann was employed there for some time, and, since he never was an enthusiastic admirer of the Stetefeldt furnace, he would surely have published facts detrimental to its reputation if results had warranted him in so doing. The Manhattan mill, Austin, Nevada, did custom work most of the time, and sometimes exclusively. After the introduction of the Stetefeldt furnace this mill not only found a great saving in the cost of roasting, but also a higher percentage of extraction as compared with roasting in reverberatory furnaces. Having bought the exclusive right to use the Stetefeldt furnace in the Reese River district, they reduced their working charges and soon monopolized the buying of ores. Later on an opposition mill was again started with a Howell furnace. It had to shut down on account of inferior extraction, *i. e.*, as shown by Ontario experiments, great loss of silver in roasting. I have no Manhattan statistics to show, but would the Manhattan Company have paid a royalty on every ton of ore put through the Stetefeldt furnace for fifteen years if it had lost ten per cent of silver in roasting?

The Lexington mill at Butte, Montana, has often been running exclusively on purchased ores, and, as I understand, with profit. Mr. Rueger, the general manager of the company, a graduate of Freiberg and an able metallurgist (but not a member of the Institute) has never complained to me about losing money in consequence of having Stetefeldt furnaces at his mill. At the time I made the comparative test between roasting in Howell and Stetefeldt furnaces at the Ontario mill I applied to Mr. Rueger for statistics on the loss of silver in roasting at his mill, but he did not see fit to grant my request.

In conclusion, I offer some explanations of the large loss of silver by roasting in the Stetefeldt furnace at Aspen, as reported by Mr. Morse.

In the first place, the quantity of ore roasted per day (from 90 to 92 tons) was unusually large; and, considering that eight per cent of sulphur in sulphurets had to be oxidized, it follows that strong draft had to be used. No long flue connects the last dust chamber with the chimney at Aspen, as is the case at the Ontario mill. Under the circumstances, it is my opinion that a more extensive system of dust chambers would have collected a large portion of the dust and fumes passing out of the chimney.

In the second place, the character of the Aspen ore is highly ahnormal, on account of the high percentage of lime and magnesia it contains. Investigations at Aspen have shown, according to Mr. Morse, that the percentage of lime and magnesia in the roasted ore is largely reduced, and it must be assumed that these metals are volatilized as chlorides, their oxides not being volatile at high heat. It seems to me highly probable that these chlorides carried silver with them and thus caused, in part, the ahnormal loss at Aspen.

MR. MORSE: Replying to Mr. Stetefeldt's remarks on the loss of silver in roasting Aspen ores with a Stetefeldt furnace, as recorded in my paper, I would say that it was not my intention to attack the Stetefeldt furnace, but simply to report the actual results obtained at Aspen.

It is unfortunate that so little reliable information has been published on this very important operation in the treatment of silver ores either for amalgamation or for lixiviation; and it was this lack of published data that prompted the writer to give the Aspen results, in the hope that a discussion would follow which would bring forth the experience of others. Mr. Stetefeldt's "general argument," however, does not fill the bill. His experiments, as recorded in *Trans.*, xiv, 341, showing the comparative losses in roasting in Howell and Stetefeldt furnaces, offer a very roundabout way of attacking a very simple problem; and he does not arrive at the all-important fact of what the loss actually was with either furnace. The fact that Mr. Hofmann did not publish facts detrimental to the Stetefeldt furnace does not show that the loss of silver in roasting in a Stetefeldt furnace is not large.

I sincerely hope that others having reliable statistics on the subject will publish them.

The results at Aspen, as published, are made up from records very carefully kept, and the calculations are based on the average of thousands of samples and assays, so that an error in a few samples or assays would not affect the general result, and it will require more than "general argument" to convince me that I am in error.

The results of a series of experiments conducted by Mr. E. B. Kirby in the chloridizing-roasting of Aspen ores, in a reverberatory furnace, will be of interest in connection with this discussion.

The ores were practically the same as those treated at Aspen, and the average of lime (CaO) was 12.3 per cent, the highest being 25.5 per cent. Eighteen lots of about one ton each were roasted in a reverberatory furnace, with salt, for a sufficient time to give fully as high "chlorination tests" as the ore roasted in a Stetefeldt furnace. Each lot was weighed, sampled and assayed before and after roasting, and the average loss in roasting, including the dust loss, was found to be 6.64 per cent.

Mr. Stetefeldt's opinion that part of the silver loss is caused by the volatilization of lime and magnesia may be correct, although this did not seem to be the case in Mr. Kirby's experiments in roasting in a reverberatory furnace, where the silver loss on the ores carrying 25.5 per cent of lime was only 5.7 per cent.

It is undoubtedly true, however, that lime and magnesia are volatilized in the chloridizing-roasting of ores. A series of experiments made by Mr. J. Dawson Hawkins at Aspen, in which four lots of ore were roasted with about 12 per cent of salt, each lot was weighed and sampled, and lime and magnesia determinations made before and after roasting, showed a loss of 22.6 per cent of the lime and 48.3 per cent of the magnesia during the operation of roasting.

World's Coins' Values in U. S. Money.

Director of the Mint Preston submits an estimate of the values of the standard coins of the world:

The franc is the monetary unit of France, Belgium and Switzerland and is worth 19.3 cents. It is coined in both gold and silver.

The mark, the standard coin of Germany, is valued at 23.8 cents, but is only minted out of the yellow metal.

The Mexican silver dollar is worth 47.9 cents.

In Japan the yen is the standard, and although coined in both gold and silver, yet the former is the nominal standard. The gold yen is worth 99.7 cents; the silver yen exchanges for 47.6 cents.

China has a silver unit—the tael—whose value varies in different colonies. Its average value is about 69 cents. The silver peso is the unit of the Central American republics, and is worth 44.1 cents.

In Chili and Cuba, where a gold peso passes as the unit, it is worth 92.6 cents. The lira is Italy's unit, and possesses the same value as the franc of France—19.3 cents. The florin of the Netherlands exchanges for 40.2 cents of United States money. It is coined in both gold and silver. The silver ruble of Russia is worth 35 3 cents; the gold ruble passes for 77.2 cents. The peseta of Spain, like the lira of Italy and franc of France, goes for 19.3 cents, and is coined in the yellow and white metals. The gold milreis of Brazil is worth 54.6 cents and the silver kran of Persia only .081 cent. The smallest gold coin unit is that of Turkey—the piaster—valued at .044 cent. The silver rupee of India exchanges for 21 cents of American money and the gold crown of Austria 20.3 cents.

BRITISH COMMENT on a statement in one of the London dailies a few days ago is "calculated to alarm those who look to railway dividends for their incomes." "American engineers seem to be all agreed that steam railways are doomed within a quarter of a century, so far as America is concerned." The comment is: "If this is true of the United States, it is difficult to see why it should not be equally true of Great Britain."

"THE country is filling up with men all the time, machines are constantly throwing more men out of employment and improvements enable the unskilled to take the place of the skilled; what is going to be the result?" asked a mechanic a few days ago. The *Scientific Machinist* thinks that is a question no one man can answer. The solution rests with the American people.

THE aluminum plates being rolled for the yacht Defender are the largest ever rolled from this metal. Some of them weigh 200 pounds, and are five-sixteenths of an inch thick, 13 feet 10 inches long and 38½ inches wide.

Buying and Selling Mines.

To the Editor:—In the last issue of your paper, "Miner" calls attention to the announcement that capitalists of New York are about to form an association for the sale of mines. He then proceeds to criticise and condemn such proposed action of the capitalists, and ends by indicating what, in his opinion, is the proper thing to do.

Many persons, I think, will fail to agree with the arguments advanced by "Miner," and to accept either his statements or deductions.

That men of wealth and standing, of experience in mining matters, and widespread influence in the money centers of the world, should determine to actively iuterest themselves in searching out good mines and then, by placing them in the markets of the world, bring iu the capital for their purchase and operation, would seem to be a substantially good thing all around. In no way does it appear that large amounts of money can be so surely and so speedily brought to this State for investmeut in mining enterprises. Nothing inspires the confidence of capital more than the experience and responsible character of those offering it investment, "Miner" to the contrary notwithstanding.

"Miner" is greatly mistaken in his assertion that "anybody" can sell miues, and without capital. To find a mine is a hard thing. To secure the privilege of selling it when found, equally as hard. And to sell it, if the proposition involves a large amount, as is usually the case when real mines are sold, is a difficult task, requiring much patience, often great labor, aud frequently the expenditure of a considerable sum of money. Every one who has tried to secure a good mine for sale, and then to sell it, knows the difficulty, uncertainty aud expense of the undertaking.

If "anybody could sell mines," as "Miner" states they can, we would all be in the business, for when the sales are made the profits are very handsome.

"Miner" is also in error in his statement that capitalists canuot understaud why men of wealth and shrewdness should offer for sale things which they themselves might be able to buy. All the world is doing this, more or less, every day. If it were not so, ordinary business would not be transacted, and uo great enterprises would ever be undertaken. In the mining industry more than in any other, does capital know that such must be the case, and in no other period of history has this fact been more couvincingly evidenced than is now shown in the great miniug centers of the world.

"Miner" is also deceived in his belief that what we want of capital is to take our prospects, develop them, repay itself for all outlays made, and then pocket the lion's share of the remainder for having done so.

What is wanted of capital is to take hold of the large propositions, and those involving great amounts of mouey, to stimulate and create confidence in the industry, and to put coin in circulation. We, of lesser means, will then be able to handle the smaller affairs, and we will all of us be profoundly glad of the coudition of things which enables us to do so, and for the opportunities and possibilities left for us. If capital should absorb the industry, from the grass roots up, we smaller fry would be robbed of our birthright, and all the incentives to manly aud persistent effort in our chosen line takeu from us.

June 27th, '95. MINER TOO.

Mineral Land Inquiry at Sacramento.

To the Editor:—Having just taken my medicine in a hearing as to the mineral character of lands at Sacramento, and seen the workings uuder which the inquiry is held, I think it will save other miners a great deal of disappointment and trouble if they know the procedurc and go prepared. The citations published in the local papers appear to be for the miner as a Government witness, but this is not so, for he must pay the expenses of taking testimony at the rate of $5 for each witness, payable in advance, before he is recognized at all. He must also have an attorney, or he will be iu the same fix with the majority of miners that went to Sacramento while I was there, and who virtually became witnesses for the railroad aud against themselves, the railroad attorney kindly volunteering to act as attorney for both sides, as he put it, to bring out the facts in the case, about like this: There is some pasture land, some could be farmed, some would raise vegetables, some timber, and the land is generally mineral in character. Then a short discourse on the goodness of the railroad company to the miner, the fairness they have again shown, and the unwarranted attacks of the newspapers and politicians. That finishes his case, and so on until a fight is made for some piece valuable for mining, and where the miner is not satisfied to prove the general mineral character but intends the specific mineral character of a certain piece of land shall be demonstrated once for all, then we have a different procedure; we find the railroad secretary has made a special trip to that part of the country, has gathered willing tools to swear to anythiug, and if they can't swear away the shafts, tunnels and mining machinery in evidence they will swear they are on some other subdivision and not on the land in question, thus making it almost absolutely necessary for the miner to have an official survey made, and to take a surveyor with him as witness.

Would it not be a good idea for some of the miners' association funds to be expended for a lawyer to be in attendance at the laud office, and not let the old miners, who go to Sacramento to save from confiscation the properties they have worked a lifetime, be made the laughing stock and tools of the company?

As to what railroad witnesses will swear to, I can give you the following sample: One piece of land in dispute was lot 6 of section 17, adjoining the town of Ophir. The ground covered by mining claim is mined out. A steam boiler is on the ground. A perpeudicular shaft ninety feet deep is in plaiu view from the county road, as are also twenty or thirty other dumps of mining shafts, sunk during a period of thirty-five years. Yet, four witnesses swore positively that there never had been any mining done on lot 6; the fifth one weakened and acknowledged there was a hole in the ground—he didn't know but it was a cellar. One witness, George Betterle, a laborer living near by, even swore the mine in question had never paid and was worked out, and if it had he would have known it. He was also able to swear the adjoining mine (Eclipse), with a U. S. patent, had never paid anything, and if it had he would have known it, when it is notorious that some of the richest ore in the camp has been taken out of these mines, some of the waste dump paying $68 a ton, and which facts are knowu by everybody in camp.

Ophir, Placer Co., Cal., June 24, '95. O. T. W.

The Pelton System of Power.

Fourteen years ago L. A. Pelton, a resident of Nevada county, invented and put upon the market what is now familiarly known as the "Pelton Water Wheel." This, like all great inventions, was so simple an affair that the wonder is it had not been thougbt of before, and yet four years of study and experimentiug were required to develop and perfect it. Little was thougbt at that time of the important part this was to play in the mining and industrial development of the Pacific coast, as well as the country at large, in future years.

The Pelton wheel was first brought into prominence by a test at the Idabo mine in Grass Valley in 1884, at which all the prominent wheels then in use in this State were represented. The Pelton showed by brake test an efficiency of 87 per cent—a result now generally obtained and sometimes exceeded in practical work—and was immediately adopted by that company, twelve of them being installed at that time and four more a year later. These sixteen wheels have been running in connection witb the mine and works of that company during all this time without stoppage and with practically no expense in the way of repair or loss of efficiency.

Since then these wheels have been sent to almost every country on the globe—more than 6000 being now in operation, running under beads varying from 12 up to 2100 feet, and aggregating some 400,000-H. P. It is quite within bounds to say that tbis is one of the most useful as well as illustrious inventions this country has ever produced, making possible the utilization of this great, natural, native force under all conditions and for every variety of service, with a useful effect never before obtained and in so simple a way that machinery may be said to be almost dispensed with.

In a series of papers under the heading of "American Supremacy in Applied Mechanics," Dr. Coleman Sellers, one of the most noted engineers of this country, makes the following statement:

"One of the most noted instances of the practical solution of a mechanical problem is given in the development of the Pelton water wheel, a system worked out entirely by and through experimentation.

"Results have been achieved by these improvements on wheels that were among the earliest used, so that the history of the Pelton wheel is typically American, and stands as a monument of human ingenuity, meeting the definition that has been given of mechanical engineering—common sense applied to practice."

Prof. Thos. Egleston, of Columbia College, an eminent hydraulic engineer, in a recent communication, says: "I have had occasion several times to recommend the Pelton wheels in the most earnest way and to bring them to the attention of engineers, as I believe them to be tbe best wheels at present in use."

Many similar statements from the highest recognized authorities on hydraulic engineering in this country, as well as in Europe, could be given, but your readers are too familiar with the practical side of this question to need any further reference.

There has been much theorizing of late about regulation in connection with water wheels operating electric generators, and, by inference, an assumption that complete success has not been attained in this way. The Pelton Water Wheel Co. do not refer to what *may be done but what has been done*, and, in verification of this statement, offer some such substantial evidence as the following. The President of the Standard Mining Co., of Bodie, says:

"Of our differential governor I cannot speak too highly. It is quick acting, sensitive and in every way reliable, and can he depended upon to take care of any changes of load that may occur at the motor end of the transmission—13 miles away. The one drawback to the use of water power for running electrical machinery—heretoforc considered insurmountable—has been the want of a governor that could be relied upon to take care of the sudden variations of load constantly occurring, more particularly when used for power purposes.

"This want you have supplied in so satisfactory a way as to leave nothing to be desired."

The President of the Redlands Electric Light and Power Co., running an 800 H. P. plant, makes the following reference to their governing appliance:

Your differential governors afford absolute control of the wheels and maintain a uniform speed on the generators under all variations of load even with the extreme changes caused by starting and stopping the 150-horse power synchronous motor at the ice house 4 miles away. The regulating device is simply perfect and meets the most exacting requirements of electrical service.

The Weaverville Electric Light Co., referring to the matter of regulation, report as follows:

The power plant furnished by you for this Company is perfect in all its appointments and has given perfect satisfactiou to all concerned. The wheel works to a high degree of efficiency and the regulation afforded by your differential governor is all that could be desired. The lights are perfectly steady under all variations of load, in fact, the plant runs itself, only one man being required in the power house. BLAKE & GIVEN.

A large number of additional references of similar character can be given, bearing upon this subject, whieh, it will be conceded, carry more weight than conjecture or theory.

San Francisco, June 26, '95. GEO. J. HENRY, JR.

The Union Gas Engine Company of San Francisco, Cal.

The illustrations in this issue of the PRESS give some idea of a few of the extensive uses to which the gas engines manufactured by the Union Gas Engine Company of San Francisco, Cal., are being applied. In view of the economy, practicability and efficiency of the Union engines, as attested by the fact that over sixteen hundred are in daily operation on this coast alone, besides the large number used in the East, a brief sketch of the origin and rapid progress of these pioneer manufacturers of gasoline engines will be of interest: Less than six years ago two small machine shops, one at 230 Fremont St. and anotber at 213 First St., in this city, respectively under the management of John F. Daly and Daniel S. Regan, began to build and place upon the market gas engines in which the explosion was effected within the cylinder by means of an electric spark. Tbough the practicability of this principle was regarded with some degree of doubt, even by mechanical engineers and men who had experimented with the older types of gas engines, there were still many who had faith in its success, and the engine with the sparking device rapidly grew in favor. In the meantime a company had been organized by John F. Daly, under the title of tbe "Pacific Gas Engine Company," and another by Daniel S. Regan, called the "Regan Vapor Engine Co." As Messrs. Daly and Regan had at one time been associated in experiments along these lines, quite naturally their engines had some points in common. This fact led to litigation tbat bid fair to seriously retard the success of both companies. After some stubborn fighting the two companies wisely decided to consolidate, which they did May 16, 1892, incorporating under the name of the "Union Gas Engine Co.," with a capital stock of $300,000. Being thus enabled to unite and preserve the best features of both engines, the result was what might have been looked for—a high-grade motive power, compact, durable and efficient. The new company, under the management of J. F. Daly, proceeded to enlarge and refit the plant at Nos. 221 and 223 First street, where it continued for two years or more to manufacture and turn out a large number of engines adapted to every purpose for which motors ranging from 1 to 80 H. P. are required. The business having now outgrown its limited quarters, tbe company decided to erect a specially designed building, with every convenience for construction tbat past experience and ingenuity could suggest.

Its new home—the present two-story brick structure—has 50 feet frontage by 150 feet in depth at 309 and 311 Howard street. The interior is arranged upon tbe "Gantry" system, the second floor being practically a broad gallery extending across the front and back the entire length of botb sides, leaving the first floor open to the light from the skylight which runs the length of the roof. Ranged along both sides of this long, light well are the lathes, drills, planers and otber appliances for conducting the work in hand. Between the galleries is a traveling crane by which tbe heavy work is bandled with comparative ease. The front end of the gallery is occupied by a bandsome suite of offices, drafting room, etc., while the front of the first floor is shared by a large show room and an arched driveway for the entrance of heavy trucks. From forty to fifty skilled men are constantly employed; the monthly pay-roll being $2500 to $3000.

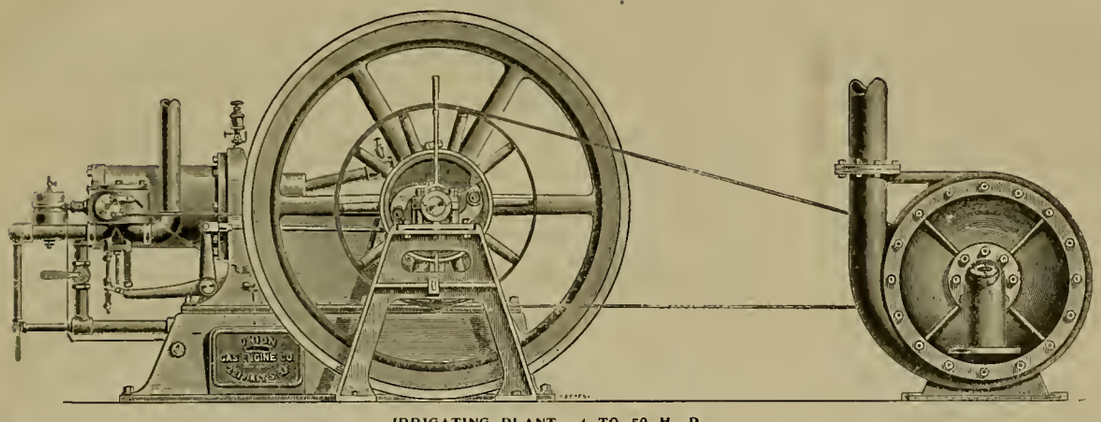
In addition to the home factory, this company has established large works in Philadelphia—the "Globe Gas Engine Co.," under the management of W. J. Casey, formerly of San Francisco, and one of the original incorporators. This move was made necessary in order to meet, with facility, the increasing demand for the "Union" engines in the Atlantic States. It has ever been the policy of the company not to allow pains, expense nor prejudice to stand in the way of needed improvements in bringing the "Union" engines up to their present high stage of perfection. Recognizing the growing demand for a simple aud economical propelling power for light pleasure craft, the company has given special attention to this branch of its business. Tbe result is a marine engine, simple and safe to operate, compact and graceful in design. To this has been recently added a new form of reverse gear, through which, by the movement of a single lever, witbout noise or jar, a boat may be driven ahead, held steady or backed with perfect ease. Tbis is an important feature, as the many devices for the purpose that have been invented and discarded clearly indicate. Tbis same mechanism is also applicable to the mine-hoisting machinery which the company manufactures. The "Union Marine Gas Engines" are now propelling boats on many waters, the craft ranging in size from launches not much larger than a skiff to freight and passenger boats of many tons burden. Quite a number of yachts and coasting schooners are also provided witb "Union" engines of from 10 to 100 H. P. as an auxiliary aid to sails in time of calms or storms.

FIGURE 2 on the first page shows the "Santa Monica," a passenger boat plying between San Pedro and Catalina Island, some 25 miles off the coast of soutbern California. Her length is 48 feet, beam 12 feet. She is fitted with a 20-H. P. "Union" marine engine, and made the run from San Francisco down the coast, a distance of 417 miles, in 41 hours. FIG. 3, "Yolo Belle," is owned by a firm in Sacramento, Cal., and carries freight and passengers on the river. Her length is 48 feet; beam, 10 feet; engine, 20-H. P.; average speed, 10 miles per bour in good water. FIG. 4 is a flat-bottomed sternwheeler, light draught, for use on Eel river and Humboldt bay, Humboldt county, California, where she has been in service about three years, giving entire satisfaction—propelled by a 15-H. P. "Union" gas engine. FIG. 5 shows the latest double-cylinder type of the "Union" marine gas engine, with improved reverse gear attached.

Besides the marine type the company builds both vertical and horizontal patterns, adapted to operating pumps for irrigation, machine shops, dairy plants, hoisting works for mines, quartz mills, electric lighting plants, etc.

It is but a few years since prejudice placed such limitation of capacity upon these engines as to quite debar them from competition with steam beyond certain very light work. As an illustration of how this feeling is giving way before practical demonstration: a few weeks ago the "Union" Company built and shipped to the Sterling Mining and Milling Company, of Payrump, Nye county, Nevada, a 25-H. P. hoisting plant of its own special design. In May the Sterling Company ordered another 25-H. P. hoisting plant, one 40-H. P. engine for stamp mill and one 40-H. P. engine for a "Huntington" roller mill, aggregating 130-H. P., still further exemplifying the extending limit of capacity of these engines. There is in course of construction by the "Union" gas engine works an 80-H. P. marine engine of special design, to be placed in the magnificent palace yacht now being built for the young California millionaire, Charles L. Fair. This engine is to be accompanied by a 6-H. P. auxiliary, which will be used as a starter for the large motor, and also to run a dynamo for lighting and heating. Tbe new craft will be 96 feet ou the water line and 18 feet beam, fitted throughout in the most thorough manner, as it is calculated to weather seas in any part of the world. While the rapid and almost phenomenal success of the "Union Gas Engine Company" is largely due to the recognized merit of the work it turns out, still an important factor in its progress has also been the untiring enterprise, ingenuity and business ability of its officers—John F. Daly, president and manager; H. P. Coles, secretary and treasurer. Cheerful response will doubtless be made to tbose who wish to obtain more detailed information in regard to the "Union Gas Engine."

Union Gas Engine Co.



IRRIGATING PLANT—4 TO 50 H. P.

Pioneer Manufacturers

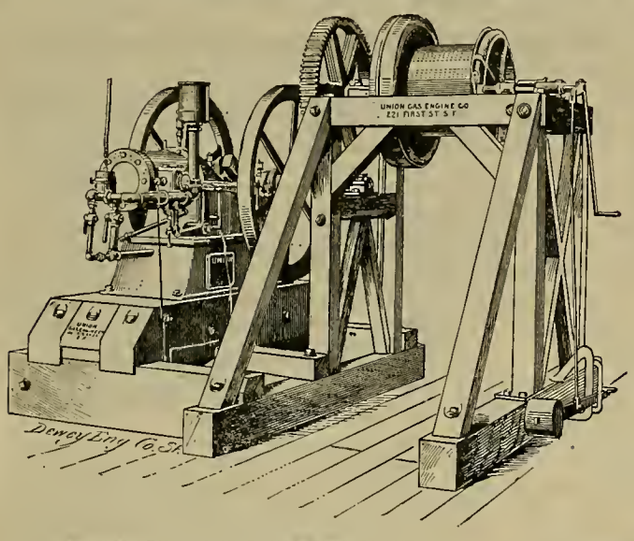
Of Gasoline Engines, and

Owners of 20 Patents

on same.

COURTLAND, April 9th, 1893.

UNION GAS ENGINE CO., San Francisco, Cal.—Gentlemen: I write to tell you how my "Union" Engine is working. The first day I got it I put it to pumping water to drain my ranch from rain and seepage water. My engine, an 8 H. P., and a No. 6 centrifugal pump, I started at 9 A. M., and it ran all day without stopping. At 10 P. M. I filled the oil cups and went to bed, and never went near it until 7 o'clock in the morning, and it was running along as smoothly as when I left it the night before. The plant had no shed or cover whatever, and was out on the side of the levee a quarter of a mile from the house. After that I started it and ran 46 hours without stopping. Had it coupled to a tank holding 110 gallons gasoline. All I did was to oil the pump, and fill the oil cups morning, noon and night, and stay away from it all the rest of the time. Now I have been away five miles from home, having my horse shod; was away from my ranch about six hours, and no one near the plant, and when I came home the plant was working as smoothly as when I left. The pump throws about 75,000 gallons an hour. Taking the plant as a whole it is a wonderful one, running on less than 15 cents an hour, requiring no engineer, and no attention whatever but supplying with gasoline and oil. I have had experience with another kind of gas engine, and can cheerfully recommend your engine and pump to any one as a safe, simple, economical and in every way satisfactory plant. Most sincerely yours, ERNEST A. GAMMON.



SINGLE DRUM 12 H. P. HOISTING PLANT,
On Keystone Mine, Lincoln, Nevada.

KEYSTONE MINE, LINCOLN, NEVADA,
Feb. 20, 1894.

GENTLEMEN:—I wish to inform you that I recently set up one of your 12 H. P. Gasoline Holsting Plants for the mine, and was greatly pleased with the operation of same. Must say that I never saw a finer working piece of machinery than this hoist. It started at once, and we never had a hitch in the two months I operated it. The incline is about 40 degrees, and we hoisted a load of about 1800 lbs. at a speed of 290 ft. per minute, and at a cost so cheap that it astonished us, and we concluded to make an accurate test in order to ascertain the exact cost, so that there would be no mistake. The oil was carefully measured and we made a run of 112 hours on 30 gallons of gasoline. This test was witnessed by the manager of the mine, and he will indorse this statement.

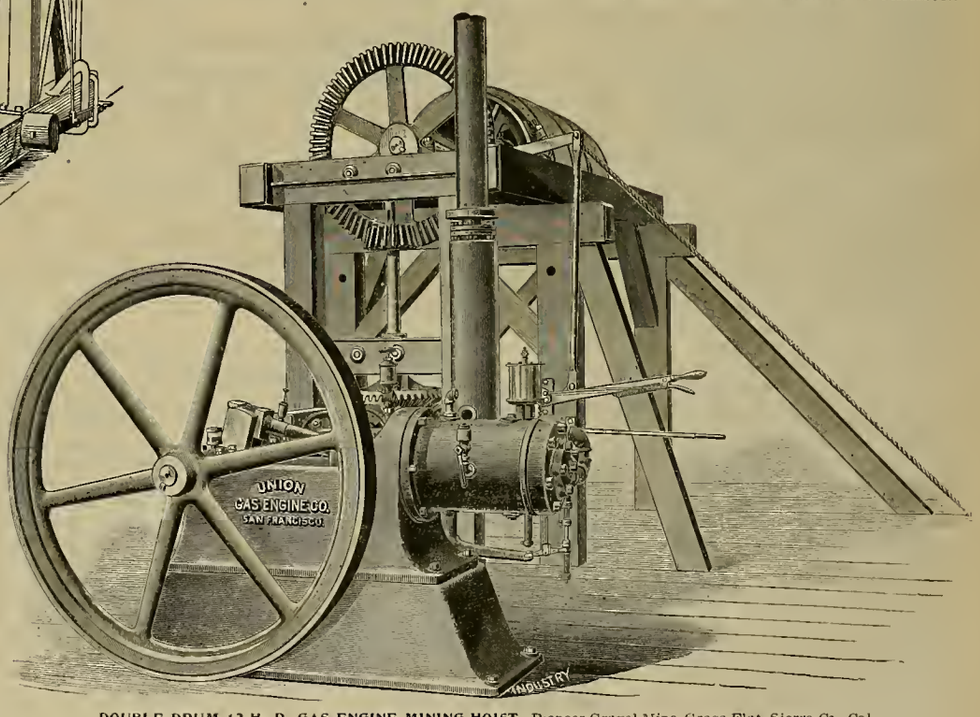
You can refer to me at any time, and I will be glad to speak a good word for your engines, for I am satisfied that when they are better understood by mining men, you will supply more mines. JAS. S. MURCHIE,
Mining Engineer.

The cut opposite is of a special form of hoisting plant as used in the Pioneer Gravel Mine, at Port Wine, near Grass Flat, Sierra county, Cal.

GRASS FLAT, SIERRA CO., CAL., Nov. 25, 1893.

UNION GAS ENGINE CO.—Gentleman: Since last July we have used one of your 12 H. P. Horizontal Gasoline Engines for hoisting and pumping. Our incline commences 1400 feet from the mouth of our tunnel, descending 150 feet with a one-foot-in-four grade. We use about 8 H. P. to pump 6000 gallons 33 feet an hour, and at the same time raise cars each holding about 3500 pounds of gravel. The tunnel is the usual-sized, single-track mining tunnel. The incline is double.

We hoist about 350 carloads each 24 hours. To do so it is only necessary to run the engine between five and six hours a day. We do some hoisting each hour, but when the engine is not actually running all expense as to fuel is cut off. With steam we would have to keep up a full head all the time, and an engineer at his post, not to mention the danger of explosions, and the consequent filling of the works with scalding steam and coal gases. Yours truly,
J. F. COWDERY,
325 Montgomery St., San Francisco, Cal.
CHAS. S. DEISEM, Superintendent of the mine.



DOUBLE DRUM 12 H. P. GAS ENGINE MINING HOIST—Pioneer Gravel Mine, Grass Flat, Sierra Co., Cal.

Illustrated Catalogues will be mailed wherever required.

Gold and Silver Product of '94.

The annual Government report of the mineral resources of the United States for the calendar year 1894, compiled under the supervision of Dr. D. T. Day, Chief of the Mineral Department of the Geological Survey, is based on reports of experts and special agents. The total product shows a decline from the output of 1893.

The total product was valued at $524,955,131. The total value of non-metallic mineral products was $305,786,343; metallic, $218,168,788, and unspecified mineral products estimated at $11,000,000.

The official result of the investigation of the metallic products for the year are as follows, arranged by quantity and value:

Pig iron, 6,657,388 loug tons, $65,007,247 valuatiou.
Silver, 49,501,122 troy ounces, $64,000,000.
Gold, 1,190,816 troy ounces, $39,500,000.
Copper, 360,244,218 pounds, $33,141,142.
Lead, 159,331 short tons, $9,942,254.
Zinc, 75,328 short tons, $5,288,026.
Quicksilver, 30,416 flasks, $934,000.
Aluminum, 550,000 pounds, $316,250.
Antimony, 200 short tons, $36,000.
Nickel, 9,616 pounds, $3269.
Platinum, 100 troy ounces, $600.

The non-metallic mineral productions are the following:

Bituminous coal, 118,820,405 short tons, $107,653,501.
Building stone, $37,092,102.
Petroleum, 49,521,757 barrels, $35,800,532.
Natnral gas, $12,000,000.
Clay (all except potters'), $9,000,000.
Cement, 360,000 barrels, $800,000.
Mineral water, 8,362,245 barrels sold, $5,030,081.
Phosphate rock, 21,569,608, $3,742,846.
Salt, 967,059 barrels, $3,395,988.
Limestone for iron flux, 11,683,703 long tons, $4,455,171.
Zinc, white, 3,368,350 short tons, $1,894,275.
Potters' clay, 21,443 long tons, $1,500,975.
Gypsum, 239,312 short tons, $761,719.
Borax, 14,680,130 pounds, $974,445.
Mineral paints, 4,192 short tons, $498,093.
Grindstones, $223,214.
Asphaltum, 60,570 short tons, $353,400.
Precious stones, $132,250.
Pyrites, 105,940 long tons, $363,134.
Corundum, 1495 short tons, $95,936.
Manganese ores, 6308 long tons, $53,635.
Sulphur, 500 short tons, $20,000.

The report says pig iron production decreased from 7,124,502 long tons to 6,657,388, and the valuation decreased nearly $20,000,000.

The gold product for the year is the largest since 1878, increasing from 1,739,081 troy ounces for 1893, with a coining value of $35,950,000. Silver production declined over 10,000,000 ounces. The rapidly increasing zinc product was checked in 1893 and 1894, and a slight decline noted in both years. The exhaustion of the Virginia pockets of ore caused a decline in the mauganese product, which was less than half the output in 1892. The nickel product was reduced to one-fifth of the 1893 output, and antimony valuation decreased $9000. The product came from Nevada and was smelted in this city.

The petroleum export was the largest yet recorded—over 100,000,000 gallons more than in 1893. The value of rough gems decreased from $264,041 in 1893 to $132,250 in 1894. The mica industry is still supplied by irregularity in mining methods, and mineral waters declined over $500,000 in value,

It will be interesting to readers of the MINING AND SCIENTIFIC PRESS, who take interest therein, to note that the United States, according to Mr. Preston's reports, stands third in the list of gold-produciug countries. Mr. Preston is usually a very careful statistician, and if he sends out a report over his official signature it is only after comparison. According to his report, which is too long to be published in detail, the yield of gold in Australasia during the calendar year 1894 was 62,856 kilograms, valued at $41,760,800; in South Africa, 60,707 kilograms, worth $40,346,000, aud in the United States 59,434 kilograms, worth $39,500,000, placing this country below Australasia and South Africa in the gold yield of '94.

Without disputing the accuracy of Mr. Preston's figures, it may be said that the Australian Department of Mines in their report, just to hand, officially give the Australasian product for '94 a total value less than that accorded it in our Mint Director's report, aggregating $35,786,426, at an average fineness of 825.

While the Director of the U. S. Mint should be an authority on fineness of gold, it is possible that allowing a higher figure for the average fineness of gold in Australasia than the facts will be found to warrant has occasioned the apparent superiority in aggregate gold yield in Australasia, and that the same thing will affect the final returns of South African gold values.

The world's annual gold yield is a difficult aggregate to procure, but without caviling with Mr. Preston's figures it may be said that his announcement in this regard is not accepted as definitely conclusive.

Robinson Gold Mining Company's Report.

The following from the general manager's report of one of the leading South African mines is interesting as illustrative of their methods and results:

Mine—Quartz milled, 9215 tons. Development—Drives, 549 feet; raises, 385 feet; crosscuts, 225 feet; shoots, 27 feet—total, 1186 feet. Main incline shaft west: Fifth level—Raises, 53 feet. Sixth level—Driving west on south reef, 23 feet; raises 32 feet; crosscuts, 70 feet. Seventh level—Driving east and west on main reef, 84 feet; raises, 30 feet. Eighth level—Driving east on main reef, 41 feet; raises, 34 feet. Ninth level—Driving east and west on main reef, 63 feet; main crosscut, 38 feet. Tenth level—Driving west ou main reef, 30 feet; raises, 8 feet; shoots, 16 feet; crosscut, 39 feet. Main incline shaft east: Fifth level—Driving east on main reef, 24 feet. Sixth level—Driving west on main reef, 45 feet; driving west on south reef, 21 feet; crosscuts, 15 feet. Seventh level—Driving west and east on main reef, 42 feet; driving east on south reef, 48 feet; raises, 112 feet; crosscuts, 9 feet. Eighth level—Driviug east on main reef, 42 feet; raises, 90 feet. Ninth level—Driving east on main reef, 59 feet; main crosscuts, 32 feet. Tenth level—Driving east on main reef, 27 feet; raises, 87 feet; main crosscuts, 22 feet—total, 1186 feet. Mill—Stamps at work, 70; net running time, 28½ days; tons crushed, 9215; tons per stamp per diem, 4.4; gold won from above, 8789 ouuces 5 dwts. Chlorination and cyanide works—Gold won from own concentrates by chlorination, 1203 ounces; bullion from tailings (cyanide process), 2011 ounces 15 dwts. From own ore, 12,004 ounces. Gold from concentrates purchased (by chlorination), 2092 ounces 18 dwts. Total, 14,096 ounces 18 dwts.

EXPENDITURE AND REVENUE.
(Crushed, 9215 tons.)

WORKING EXPENDITURE.		Cost per ton
Mining account, including mine maintenance	£ 7,490 3 0	£0 16 3.08
Milling account, including mill maintenance	1,875 11 7	0 4 0.85

		£52,838 17 11

The sum of £11,108 7s 7d was expended on account of mill extension during the month.

In a recent lecture on the use of aluminum in vessel construction, Mr. Yarrow, the noted English shipbuilder, said that the two great enemies of the metal are heat and alkalies. The metal anneals at a comparatively low temperature, thus losing strength, while alkalies act very rapidly upon it. Consequently any part liable to be subject to a considerable rise of temperature should not be made of aluminum, nor should it be used for a condenser where soda may be required for cleaning purposes. Alumiuum at high temperatures oxidizes with exceptional rapidity. At low temperatures it does not oxidize so rapidly, and the film of oxide on the surface protects the metal from further action.

PROFESSOR CARL MYERS of Frankfort, N. Y., has begun supplyiug ocean vessels with balloon outfits. A tank containing the materials for generating hydrogen gas, to inflate the bag, is provided with the necessary fittiugs and cork. It is believed that the same wind which sends a ship ashore can be made to carry a line to life-savers on the beach.

DURING the meeting of the American Institute of Electrical Eugineers at Niagara Falls this week, the formal starting of the great plant of the Niagara Falls Power Company will occur. At present only one of the 5000 horse power dynamos is in place, ready to supply local customers, but work on two more of them is in progress.

OVER 84,330,800 barrels of petroleum were produced in 1894. These figures cover the total production of the world. Of this amount the United States produced 57 per cent and Russia 40 per cent. In 1859 the total production of the United States was only 2000 barrels.

ELECTRIC LAMPS of one-candle power, operated by a storage battery weighing 2½ pounds, and good for ten hours without recharging, are among the latest novelties. The battery is about six inches high and two inches square.

Mining in Old Mexico.

Mining in Mexico is not in a depressed condition because of the low price of silver. This particular industry is prosperous there. The peso or dollar and onza Mexicana is now, and always was, on its equality or standard ratio of $1.21 to one ounce. The peso or onza buys as much there to-day of all the necessaries of life as it always did, and the man in Mexico who works out his silver mine has never felt or known that silver has dropped in value. On the contrary, he has been largely benefited by the drop in silver, as most mines contain in addition gold and other metals which are always paid for according to the gold standard; that is, for his silver he iu turn receives his silver in dollars, and there can be no loss while for his gold he receives to-day from $36 to $38 per ounce in silver.

Under the new Mexican law mining is especially encouraged. The preliminary denouncement of a mine costs from $15 to $25 and requiries publication in the official paper of the capital of the State for ninety consecutive days. At the end, if the party desires a patent, he pays the federal treasury $10 for each pentenencia 325 feet square; hereafter an annual tax is demanded of $10 per pentenencia, and no further obligation or work is required. Prices vary from responsible positions at $4 per day to $1.25, which, when the capital comes in gold from the outside and is exchanged into Mexican silver, makes it doubly cheap. Hundreds of mines in Mexico are paying handsome dividends, which in the States could not be worked at all under the present silver depression.

The famous Candelaria mine, which has paid its successive owners in the course of 200 years over $150,000,000, is now working on ore which pans only $25 to $28 per ton. The San Dimas district, in which the Candelaria is situated, is said to be the richest in Mexico. Most of the large mines there are in the hands of Americans. The Candelaria, owned by D. M. Burns and Clarence Matertiame of this city, a group of mines belonging to the Hearst-Haggin Co.; the Coronado property of J. N. E. Wilsou, and the Promontores, an old mine recently acquired by F. M. Ochoa and other San Franciscans. All these mines, except the latter, are low grades of free milling gold ores, while the Promontores hardly goes ten per cent above the others. It is the present advantage of exchange and cheap labor which more than anything else makes those profitable.

Silver-Lead Ore Sampling.

Sealed proposals are invited by the Secretary of the Treasury for the sampling and assaying of lead ores imported into the United States under the provisions of the tariff act. This act imposes a duty of three-fourths of one cent per pound on the lead contained in silver-lead ores, aud under its provisions it is necessary that facilities for sampling and assaying shall be provided, at the expense of the party receiving the contract, at each of the ports at which silver-lead ores are imported. The method of sampling and assaying such ores is to be the same as that usually adopted for commercial purposes by public sampling works in the United States, and the bidder must stand under oath for the facilities under their control for performing the service, and the method in detail which they propose to use. The right is reserved to reject any or all bids, and to award the contract to one bidder for all the work, or to accept separate bids for the general ports at which ores are imported.

SOME usefnl products from what may be termed a novel source are enumerated by the *Revue Scientifique*, as showing the ingenuity and diversification of modern industry, and the value of that bandit of the sea, the shark. Thus the liver of this predatory creature is found to contain an oil of a beautiful color, which never becomes turbid, and possesses medicinal qualities of a very valuable character; the skin, after being dried, takes the polish and hardness of mother of pearl, and on being marbled bears a resemblance to fossil coral, so that it is employed by jewelers for the manufacture of fancy objects, by binders for making shagreen, and by cabiuet makers for polishing wood; the fins, independent of use by some as an article of food, are superior for conversion into fish glue, competing in this line with the well-known sturgeon glue prepared in Russia, and are used for clarifying beer, wine and other liquors, also for the preparation of English taffetas, and as reagents in chemistry, etc.; the flesh, too, despite its oily taste, is in some places eaten as food.

THE first manufacturing establishment at a distance from Niagara to contract with the power company for electricity from the great cataract is the Plumb, Burdict & Barnard Bolt and Nut Works of North Tonawanda, twelve miles away. This company will use about 200 horse power, applied through sixteen motors.

TO BE CONSTANTLY QUOTED is certainly a sure sign of successful newspaper work. It means that the best judge of a newspaper, the exchange editor, is passing his favorable opinion.—The Fourth Estate.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Buying and Selling Mines.

To THE EDITOR:—In the last issue of your paper, "Miner" calls attention to the announcement that capitalists of New York are about to form an association for the sale of mines. He then proceeds to criticise and condemn such proposed action of the capitalists, and ends by indicating what, in his opinion, is the proper thing to do.

Many persons, I think, will fail to agree with the arguments advanced by "Miner," and to accept either his statements or deductions.

That men of wealth and standing, of experience in mining matters, and widespread influence in the money centers of the world, should determine to actively interest themselves in searching out good mines and then, by placing them in the markets of the world, bring in the capital for their purchase and operation, would seem to be a substantially good thing all around. In no way does it appear that large amounts of money can be so surely and so speedily brought to this State for investment in mining enterprises. Nothing inspires the confidence of capital more than the experience and responsible character of those offering it investment, "Miner" to the contrary notwithstanding.

"Miner" is greatly mistaken in his assertion that "anybody" can sell mines, and without capital. To find a mine is a hard thing. To secure the privilege of selling it when found, equally as hard. And to sell it, if the proposition involves a large amount, as is usually the case when real mines are sold, is a difficult task, requiring much patience, often great labor, and frequently the expenditure of a considerable sum of money. Every one who has tried to secure a good mine for sale, and then to sell it, knows the difficulty, uncertainty and expeuse of the undertaking.

If "anybody could sell mines," as "Miner" states they can, we would all be in the business, for when the sales are made the profits are very handsome.

"Miner" is also in error in his statement that capitalists cannot understand why men of wealth and shrewdness should offer for sale things which they themselves might be able to buy. All the world is doing this, more or less, every day. If it were not so, ordinary business would not be transacted, and no great enterprises would ever be undertaken. In the mining industry more than in any other, does capital know that such must be the case, and in no other period of history has this fact been more convincingly evidenced than is now shown in the great miniug centers of the world.

"Miner" is also deceived in his belief that what we want of capital is to take our prospects, develop them, repay itself for all outlays made, and then pocket the lion's share of the remainder for having done so.

What is wanted of capital is to take hold of the large propositions, and those involving great amounts of money, to stimulate and create confidence in the industry, and to put coin in circulation. We, of lesser means, will then be able to handle the smaller affairs, and we will all of us be profoundly glad of the condition of things which enables us to do so, and for the opportunities aud possibilities left for us. If capital should absorb the industry, from the grass roots up, we smaller fry would be robbed of our birthright, and all the incentives to manly and persistent effort in our chosen line taken from us.

June 27th, '95. MINER TOO.

Mineral Land Inquiry at Sacramento.

To THE EDITOR: — Haviug just taken my medicine in a hearing as to the mineral character of lands at Sacramento, and seen the workings under which the inquiry is held, I think it will save other miners a great deal of disappointment and trouble if they know the procedure and go prepared. The citations published in the local papers appear to be for the miner as a Government witness, but this is not so, for he must pay the expenses of taking testimony at the rate of $5 for each witness, payable in advance, before he is recognized at all. He must also have an attorney, or he will be in the same fix with the majority of miners that went to Sacramento while I was there, and who virtually became witnesses for the railroad and against themselves, the railroad attorney kindly volunteering to act as attorney for both sides, as he put it, to bring out the facts in the case, about like this: There is some pasture land, some could be farmed, some would raise vegetables, some timber, and the land is generally mineral in character. Then a short discourse on the goodness of the railroad company to the miner, the fairness they have again shown, and the unwarranted attacks of the newspapers and politicians. That finishes his case, and so on until a fight is made for some piece valuable for mining, and where the miner is not satisfied to prove the general mineral character but intends the specific mineral character of a certain piece of land shall be demonstrated once for all, then we have a different procedure; we find the railroad secretary has made a special trip to that part of the country, has gathered willing tools to swear to anything, and if they can't swear away the shafts, tunnels and mining machinery in evidence they will swear they are on some other subdivision and not on the land in question, thus making it almost absolutely necessary for the miner to have an official survey made, and to take a surveyor with him as witness.

Would it not be a good idea for some of the miners' association funds to be expended for a lawyer to be in attendance at the land office, and not let the old miners, who go to Sacramento to save from confiscation the properties they have worked a lifetime, be made the laughing stock and tools of the company?

As to what railroad witnesses will swear to, I can give you the following sample: One piece of land in dispute was lot 6 of section 17, adjoining the town of Ophir. The ground covered by mining claim is mined out. A steam boiler is on the ground. A perpendicular shaft ninety feet deep is in plain view from the county road, as are also twenty or thirty other dumps of mining shafts, sunk during a period of thirty-five years. Yet, four witnesses swore positively that there never had been any mining done on lot 6; the fifth one weakened and acknowledged there was a hole in the ground—he didn't know but it was a cellar. One witness, George Betterle, a laborer living near by, even swore the mine in question had never paid and was worked out, and if it had he would have known it. He was also able to swear the adjoining mine (Eclipse), with a U. S. patent, had never paid anything, and if it had he would have known it, when it is notorious that some of the richest ore in the camp has been taken out of these mines, some of the waste dump paying $68 a ton, and which facts are known by everybody in camp.

Ophir, Placer Co., Cal., June 24, '95. O. T. W.

The Pelton System of Power.

Fourteen years ago L. A. Pelton, a resident of Nevada county, invented and put upon the market what is now familiarly known as the "Pelton Water Wheel." This, like all great inventions, was so simple an affair that the wonder is it had not been thought of before, and yet four years of study and experimenting were required to develop and perfect it. Little was thougbt at that time of the important part this was to play in the mining and industrial development of the Pacific coast, as well as the country at large, in future years.

The Pelton wheel was first brought into prominence by a test at the Idabo mine in Grass Valley in 1884, at which all the prominent wheels then in use in this State were represented. The Pelton showed by brake test an efficiency of 87 per cent—a result now generally obtained and sometimes exceeded in practical work—and was immediately adopted by that company, twelve of them being installed at that time and four more a year later. These sixteen wheels have been running in connection witb the mine and works of that company during all this time without stoppage and with practically no expense in tbe way of repair or loss of efficiency.

Since then these wheels have been sent to almost every country on the globe—more than 6000 being now in operation, running under beads varying from 12 up to 2100 feet, and aggregating some 400,000-H. P. It is quite within bounds to say that tbis is one of the most useful as well as illustrious inventions this country has ever produced, making possible the utilization of this great, natural, native force under all conditions and for every variety of service, with a useful effect never before obtained and in so simple a way that machinery may be said to be almost dispensed with.

In a series of papers under the heading of "American Supremacy in Applied Mechanics," Dr. Coleman Sellers, one of tbe most noted engineers of this country, makes the following statement:

"One of tbe most noted instances of the practical solution of a mechanical problem is given in the development of the Pelton water wheel, a system worked out entirely by and through experimentation.

"Results have been achieved by these improvements on wheels that were among the earliest used, so that the history of the Peltou wheel is typically American, and stands as a monument of human ingenuity, meeting the definition that has been given of mechanical engineering—common sense applied to practice."

Prof. Thos. Egleston, of Columbia College, an eminent hydraulic engineer, in a recent communication, says: "I have bad occasion several times to recommend the Pelton wheels in the most earnest way and to bring them to the attention of engineers, as I believe them to be the best wheels at present in use."

Many similar statements from the highest recognized authorities on hydraulic engineering in this country, as well as in Europe, could be given, but your readers are too familiar with the practical side of this question to need any further reference.

There has been much theorizing of late about regulation in connection with water wheels operating electric generators, and, by inference, an assumption that complete success has not been attained in this way. The Pelton Water Wheel Co. do not refer to what *may be done but what has been done*, and, in verification of this statement, offer some such substantial evidence as the following. The President of the Standard Mining Co., of Bodie, says:

"Of our differential governor I cannot speak too highly. It is quick acting, sensitive and in every way reliable, and can be depended upon to take care of any changes of load that may occur at the motor end of the transmission—13 miles away. The one drawback to the use of water power for running electrical machinery—heretofore considered insurmountable—has been the want of a governor that could be relied upon to take care of the sudden variations of load constantly occurring, more particularly when used for power purposes.

"This want you have supplied in so satisfactory a way as to leave nothing to be desired."

The President of the Redlands Electric Light and Power Co., running an 800 H. P. plant, makes the following reference to their governing appliance:

Your differential governors afford absolute control of the wheels and maintain a uniform speed on the generators under all variations of load even with the extreme changes caused by starting and stopping the 150-horse power synchronous motor at the ice house 4 miles away. The regulating device is simply perfect and meets the most exacting requirements of electrical service.

The Weaverville Electric Light Co., referring to the matter of regulation, report as follows:

The power plant furnished by you for this Company is perfect in all its appointments and has given perfect satisfaction to all concerned. The wheel works to a high degree of efficiency and the regulation afforded by your differential governor is all that could be desired. The lights are perfectly steady under all variations of load, in fact, the plant runs itself, only one man being required in the power house. BLAKE & GIVEN.

A large number of additional references of similar character can be given, bearing upon this subject, which, it will be conceded, carry more weight than conjecture or theory.

San Francisco, June 26, '95. GEO. J. HENRY, JR.

The Union Gas Engine Company of San Francisco, Cal.

The illustrations in this issue of the PRESS give some idea of a few of the extensive uses to which the gas engines manufactured by the Union Gas Engine Company of San Francisco, Cal., are being applied. In view of the economy, practicability and efficiency of the Union engines, as attested by the fact that over sixteen hundred are in daily operation on this coast alone, besides the large number used in the East, a brief sketch of the origin and rapid progress of these pioneer manufacturers of gasoline engines will be of interest: Less than six years ago two small machine shops, one at 230 Fremont St. and another at 213 First St., in this city, respectively under the management of John F. Daly and Daniel S. Regan, began to build and place upon the market gas engines in which the explosion was effected within the cylinder by means of an electric spark. Though the practicability of this principle was regarded with some degree of doubt, even by mechanical engineers and men who had experimented with the older types of gas engines, there were still many who had faith in its success, and the engine with tbe sparking device rapidly grew in favor. In the meantime a company had been organized by John F. Daly, under the title of the "Pacific Gas Engine Company," and another by Daniel S. Regan, called the "Regan Vapor Engine Co." As Messrs. Daly and Regan had at one time been associated in experiments along these lines, quite naturally their engines had some points in common. This fact led to litigation tbat bid fair to seriously retard the success of both companies. After some stubborn figbting the two companies wisely decided to consolidate, which they did May 16, 1892, incorporating under the name of the "Union Gas Engine Co.," with a capital stock of $300,000. Being thus enabled to unite and preserve the best features of both engines, the result was what might have been looked for—a high-grade motive power, compact, durable and efficient. The new company, under the management of J. F. Daly, proceeded to enlarge and refit the plant at Nos. 221 and 223 First street, where it continued for two years or more to manufacture and turn out a large number of engines adapted to every purpose for which motors ranging from 1 to 80 H. P. are required. The business having now outgrown its limited quarters, tbe company decided to erect a specially designed building, with every convenience for construction that past experience and ingenuity could suggest.

Its new home—the present two-story brick structure—has 50 feet frontage by 150 feet in depth at 309 and 311 Howard street. The interior is arranged upon tbe "Gantry" system, the second floor being practically a broad gallery extending across the front and back the entire length of both sides, leaving the first floor open to the light from the skylight which runs the length of the roof. Ranged along both sides of this long, light well are the lathes, drills, planers and other appliances for conducting the work in hand. Between the galleries is a traveling crane by which tbe heavy work is handled with comparative ease. The front end of the gallery is occupied by a handsome suite of offices, drafting room, etc., while the front of the first floor is shared by a large show room and an arched driveway for tbe entrance of heavy trucks. From forty to fifty skilled men are constantly employed; the monthly pay-roll being $2500 to $3000.

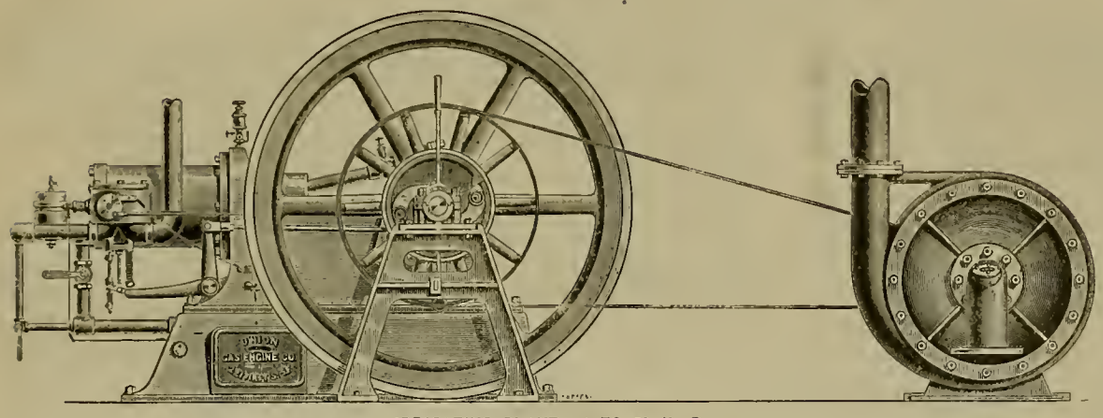
In addition to the home factory, this company has established large works in Philadelphia—the "Globe Gas Engine Co.," under the management of W. J. Casey, formerly of San Francisco, and one of the original incorporators. This move was made necessary in order to meet, with facility, the increasing demand for the "Union" engines in the Atlantic States. It has ever been the policy of the company not to allow pains, expense nor prejudice to stand in tbe way of needed improvements in bringing the "Union" engines up to tbeir present high stage of perfection. Recognizing the growing demand for a simple and economical propelling power for light pleasure craft, the company has given special attention to this branch of its business. The result is a marine engine, simple and safe to operate, compact and graceful in design. To this has been recently added a new form of reverse gear, through which, by the movement of a single lever, without noise or jar, a boat may be driven ahead, held steady or backed with perfect ease. This is an important feature, as the many devices for the purpose that have been invented and discarded clearly indicate. This same mechanism is also applicable to tbe mine-hoisting machinery which the company manufactures. The "Union Marine Gas Engines" are now propelling boats on many waters, the craft ranging in size from launches not much larger than a skiff to freight and passenger boats of many tons burden. Quite a number of yachts and coasting schooners are also provided with "Union" engines of from 10 to 100 H. P. as an auxiliary aid to sails in time of calms or storms.

FIGURE 2 on the first page shows the "Santa Monica," a passenger boat plying between San Pedro and Catalina Island, some 25 miles off the coast of southern California. Her length is 48 feet, beam 12 feet. She is fitted with a 20-H. P. "Union" marine engine, and made the run from San Francisco down the coast, a distance of 417 miles, in 41 hours. FIG. 3, "Yolo Belle," is owned by a firm in Sacramento, Cal., and carries freight and passengers on the river. Her length is 48 feet; beam, 10 feet; engine, 20-H. P.; average speed, 10 miles per hour in good water. FIG. 4 is a flat-bottomed stern-wheeler, light draught, for use on Eel river and Humboldt bay, Humboldt county, California, where she has been in service about three years, giving entire satisfaction—propelled by a 15-H. P. "Union" gas engine. FIG. 5 shows the latest double-cylinder type of the "Union" marine gas engine, with improved reverse gear attached.

Besides the marine type the company builds both vertical and horizontal patterns, adapted to operating pumps for irrigation, machine shops, dairy plants, hoisting works for mines, quartz mills, electric lighting plants, etc.

It is but a few years since prejudice placed such limitation of capacity upon tbese engines as to quite debar them from competition with steam beyond certain very light work. As an illustration of how this feeling is giving way before practical demonstration: a few weeks ago the "Union" Company built and shipped to the Sterling Mining and Milling Company, of Payrump, Nye county, Nevada, a 25-H. P. hoisting plant of its own special design. In May the Sterling Company ordered another 25-H. P. hoisting plant, one 40-H. P. engine for stamp mill and one 40-H. P. engine for a "Huntington" roller mill, aggregating 130-H. P., still further exemplifying the extending limit of capacity of these engines. There is in course of construction by the "Union" gas engine works an 80-H. P. marine engine of special design, to be placed in the magnificent palace yacht now being built for the young California millionaire, Charles L. Fair. This engine is to be accompanied by a 6-H. P. auxiliary, which will be used as a starter for the large motor, and also to run a dynamo for lighting and heating. The new craft will be 96 feet on the water line and 18 feet beam, fitted throughout in the most thorough manner, as it is calculated to weather seas in any part of the world. While the rapid and almost phenomenal success of the "Union Gas Engine Company" is largely due to tbe recognized merit of the work it turns out, still an important factor in its progress has also been the untiring enterprise, ingenuity and business ability of its officers—John F. Daly, president and manager; H. P. Coles, secretary and treasurer. Cheerful response will doubtless be made to those who wish to obtain more detailed information in regard to the "Union Gas Engine."

Union Gas Engine Co.



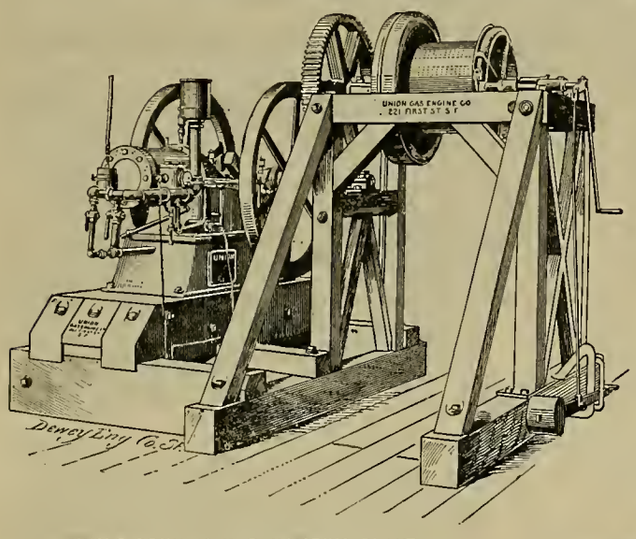
IRRIGATING PLANT—4 TO 50 H. P.

Pioneer Manufacturers

Of Gasoline Engines, and Owners of 20 Patents on same.

COURTLAND, April 9th, 1893.

UNION GAS ENGINE CO., San Francisco, Cal.—Gentlemen: I write to tell you how my "Union" Engine is working. The first day I got it I put it to pumping water to drain my ranch from rain and seepage water. My engine, an 8 H. P., and a No. 6 centrifugal pump, I started at 9 A. M., and it ran all day without stopping. At 10 P. M. I filled the oil cups and went to bed, and never went near it until 7 o'clock in the morning, and it was running along as smoothly as when I left it the night before. The plant had no shed or cover whatever, and was out on the side of the levee a quarter of a mile from the house. After that I started it and ran 46 hours without stopping. Had it coupled to a tank holding 110 gallons gasoline. All I did was to oil the pump, and fill the oil cups morning, noon and night, and stay away from it all the rest of the time. Now I have been away five miles from home, having my horse shod; was away from my ranch about six hours, and no one near the plant, and when I came home the plant was working as smoothly as when I left. The pump throws about 75,000 gallons an hour. Taking the plant as a whole it is a wonderful one, running on less than 15 cents an hour, requiring no engineer, and no attention whatever but supplying with gasoline and oil. I have had experience with another kind of gas engine, and can cheerfully recommend your engine and pump to any one as a safe, simple, economical and in every way satisfactory plant. Most sincerely yours, ERNEST A. GAMMON.



SINGLE DRUM 12 H. P. HOISTING PLANT,
On Keystone Mine, Lincoln, Nevada.

KEYSTONE MINE, LINCOLN, NEVADA,
Feb. 20, 1894.

GENTLEMEN:—I wish to inform you that I recently set up one of your 12 H. P. Gasoline Hoisting Plants for the mine, and was greatly pleased with the operation of same. Must say that I never saw a finer working piece of machinery than this hoist. It started at once, and we never had a hitch in the two months I operated it. The incline is about 40 degrees, and we hoisted a load of about 1800 lbs. at a speed of 200 ft. per minute, and at a cost so cheap that it astonished us, and we concluded to make an accurate test in order to ascertain the exact cost, so that there would be no mistake. The oil was carefully measured and we made a run of 112 hours on 30 gallons of gasoline. This test was witnessed by the manager of the mine, and he will indorse this statement.

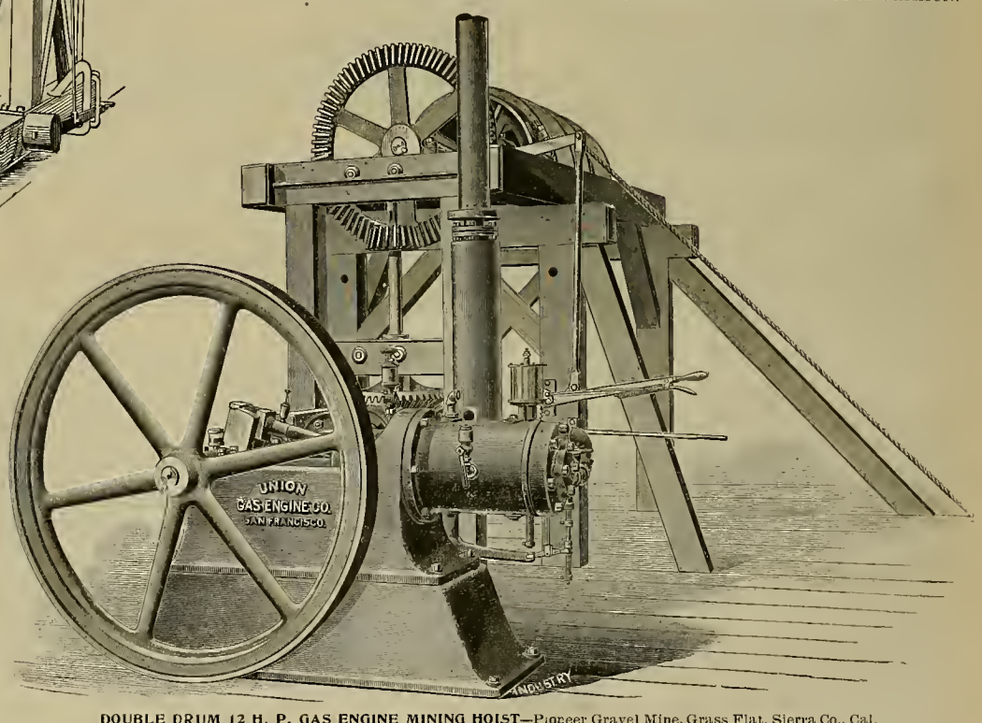
You can refer to me at any time, and I will be glad to speak a good word for your engines, for I am satisfied that when they are better understood by mining men, you will supply more mines. JAS. S. MURCHIE,
Mining Engineer.

The cut opposite is of a special form of hoisting plant as used in the Pioneer Gravel Mine, at Port Wine, near Grass Flat, Sierra county, Cal.

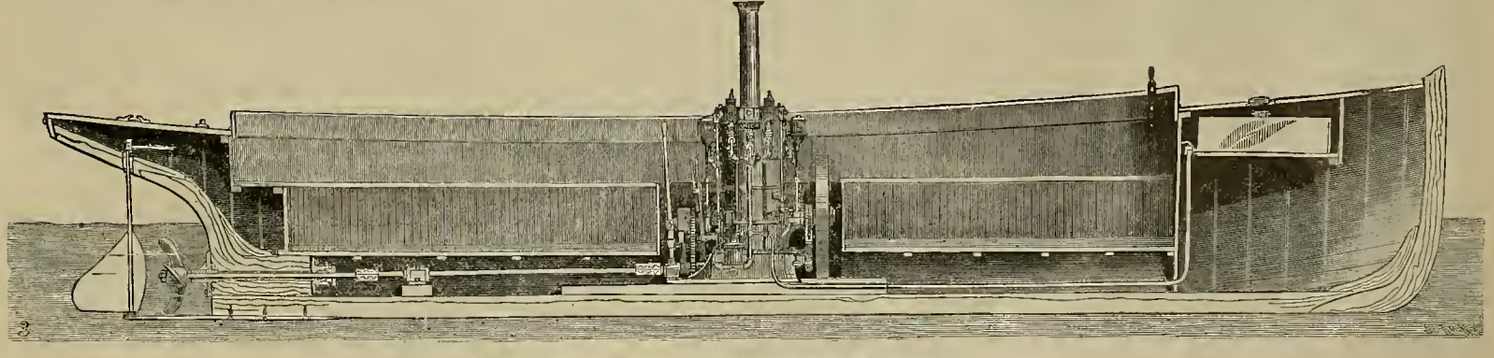
GRASS FLAT, SIERRA CO., CAL., Nov. 25, 1893.

UNION GAS ENGINE CO.—Gentleman: Since last July we have used one of your 12 H. P. Horizontal Gasoline Engines for hoisting and pumping. Our incline commences 1400 feet from the mouth of our tunnel, descending 150 feet with a one-foot-in-four grade. We use about 8 H. P. to pump 6000 gallons 33 feet an hour, and at the same time raise cars each holding about 3500 pounds of gravel. The tunnel is the usual-sized, single-track mining tunnel. The incline is double.

We hoist about 350 carloads each 24 hours. To do so it is only necessary to run the engine between five and six hours a day. We do some hoisting each hour, but when the engine is not actually running all expense as to fuel is cut off. With steam we would have to keep up a full head all the time, and an engineer at his post, not to mention the danger of explosions, and the consequent filling of the works with scalding steam and coal gases. Yours truly,
J. F. COWDERY,
325 Montgomery St., San Francisco, Cal.
CHAS. S. DEISEM, Superintendent of the mine.



DOUBLE DRUM 12 H. P. GAS ENGINE MINING HOIST—Pioneer Gravel Mine, Grass Flat, Sierra Co., Cal.



SECTION SHOWING UNION GASOLINE ENGINE IN OPEN LAUNCH.

UNION GAS ENGINE CO., 309-311 Howard St., San Francisco, California, U.S.A.

Illustrated Catalogues will be mailed wherever required.

Gold and Silver Product of '94.

The annual Government report of the mineral resources of the United States for the calendar year 1894, compiled under the supervision of Dr. D. T. Day, Chief of the Mineral Department of the Geological Survey, is based on reports of experts and special agents. The total product shows a decline from the output of 1893.

The total product was valued at $524,955,131. The total value of non-metallic mineral products was $305,786,343; metallic, $218,168,788, and unspecified mineral products estimated at $11,000,000.

The official result of the investigation of the metallic products for the year are as follows, arranged by quantity and value:

Pig iron, 6,657,388 long tons, $65,007,247 valuation.
Silver, 49,501,122 troy ounces, $64,000,000.
Gold, 1,190,816 troy ounces, $39,500,000.
Copper, 360,244,218 pounds, $33,141,142.
Lead, 159,331 short tous, $9,942,254.
Zinc, 75,328 short tons, $5,288,026.
Quicksilver, 30,416 flasks, $934,000.
Aluminum, 550,000 pounds, $316,250.
Antimony, 200 short tons, $36,000.
Nickel, 9,616 pounds, $3269.
Platinum, 100 troy ounces, $600.

The non-metallic miueral productions are the following:

Bituminous coal, 118,820,405 short tons, $107,653,501.
Building stone, $37,092,102.
Petroleum, 49,521,757 barrels, $35,800,532.
Natural gas, $12,000,000.
Clay (all except potters'), $9,000,000.
Cement, 360,000 barrels, $800,000.
Mineral water, 8,362,245 barrels sold, $5,030,081.
Phosphate rock, 21,569,608, $3,742,846.
Salt, 967,059 barrels, $3,395,988.
Limestone for iron flux, 11,683,703 long tons, $4,455,171.
Zinc, white, 3,368,350 short tons, $1,894,275.
Potters' clay, 21,443 long tons, $1,500,975.
Gypsum, 239,312 short tons, $761,719.
Borax, 14,680,130 pounds, $974,445.
Mineral paints, 4,192 short tons, $498,093.
Grindstones, $223,214.
Asphaltum, 60,570 short tons, $353,400.
Precious stones, $132,250.
Pyrites, 105,940 long tons, $363,134.
Corundum, 1495 short tons, $95,936.
Manganese ores, 6308 long tous, $53,635.
Sulphur, 500 short tons, $20,000.

The report says pig iron production decreased from 7,124,502 long tons to 6,657,388, and the valuation decreased nearly $20,000,000.

The gold product for the year is the largest since 1878, increasing from 1,739,081 troy ounces for 1893, with a coining value of $35,950,000. Silver production declined over 10,000,000 ounces. The rapidly increasing zinc product was checked in 1893 and 1894, and a slight decline noted iu both years. The exhaustion of the Virginia pockets of ore caused a decline in the mauganese product, which was less than half the output in 1892. The nickel product was reduced to one-fifth of the 1893 output, and antimony valuation decreased $9000. The product came from Nevada and was smelted in this city.

The petroleum export was the largest yet recorded—over 100,000,000 gallons more than in 1893. The value of rough gems decreased from $264,041 in 1893 to $132,250 in 1894. The mica industry is still supplied by irregularity in mining methods, and mineral waters declined over $500,000 in value,

It will be interesting to readers of the MINING AND SCIENTIFIC PRESS, who take interest therein, to note that the United States, according to Mr. Preston's reports, stands third in the list of gold-producing countries. Mr. Preston is usually a very careful statistician, and if he sends out a report over his official siguature it is only after comparison. According to his report, which is too long to be published in detail, the yield of gold in Australasia during the calendar year 1894 was 62,856 kilograms, valued at $41,760,800; in South Africa, 60,707 kilograms, worth $40,346,000, and in the United States 59,434 kilograms, worth $39,500,000, placing this country below Australasia and South Africa in the gold yield of '94.

Without disputing the accuracy of Mr. Preston's figures, it may be said that the Australiau Department of Miues in their report, just to haud, officially give the Australasian product for '94 a total value less than that accorded it in our Mint Director's report, aggregating $35,786,426, at an average fineness of 825.

While the Director of the U. S. Mint should be an authority on fineness of gold, it is possible that allowing a higher figure for the average fineness of gold in Australasia than the facts will be found to warrant has occasioned the apparent superiority in aggregate gold yield in Australasia, and that the same thing will affect the final returns of South African gold values.

The world's annual gold yield is a difficult aggregate to procure, but without caviliug with Mr. Preston's figures it may be said that his announcement in this regard is not accepted as definitely conclusive.

Robinson Gold Mining Company's Report.

The following from the general manager's report of one of the leading South African mines is interesting as illustrative of their methods and results:

Mine—Quartz milled, 9215 tons. Development—Drives, 549 feet; raises, 385 feet; crosscuts, 225 feet; shoots, 27 feet—total, 1186 feet. Main incline shaft west: Fifth level—Raises, 53 feet. Sixth level—Driving west on south reef, 23 feet; raises 32 feet; crosscuts, 70 fect. Seventh level—Driving east and west on main reef, 84 feet; raises, 30 feet. Eighth level—Driving east on main reef, 41 feet; raises, 34 feet. Ninth level—Driving east and west on main reef, 63 feet; main crosscut, 38 feet. Tenth level—Driving west on main reef, 30 feet; raises, 8 feet; shoots, 16 feet; crosscut, 39 feet. Main incline shaft east: Fifth level—Driving east on main reef, 24 feet. Sixth level—Driving west on main reef, 45 feet; driving west on south reef, 21 feet; crosscuts, 15 feet. Seventh level—Driving west and east on main reef, 42 feet; driving east on south reef, 48 feet; raises, 112 feet; crosscuts, 9 feet. Eighth level—Driving east on main reef, 42 feet; raises, 90 feet. Ninth level—Driving east on main reef, 59 feet; main crosscuts, 32 feet. Tenth level—Driviug east on main reef, 27 feet; raises, 87 feet; main crosscuts, 22 feet—total, 1186 feet. Mill—Stamps at work, 70; net running time, 28½ days; tons crushed, 9215; tons per stamp per diem, 4.4; gold won from above, 8789 ouuces 5 dwts. Chlorination and cyanide works—Gold won from own concentrates by chlorination, 1203 ounces; bullion from tailings (cyanide process), 2011 ounces 15 dwts. From own ore, 12,004 ounces. Gold from concentrates purchased (by chlorination), 2092 ounces 18 dwts. Total, 14,096 ounces 18 dwts.

EXPENDITURE AND REVENUE.

The sum of £11,108 7s 7d was expended on account of mill extension during the month.

In a recent lecture on the use of aluminum in vessel construction, Mr. Yarrow, the noted English shipbuilder, said that the two great enemies of the metal are heat and alkalies. The metal anneals at a comparatively low temperature, thus losing strength, while alkalies act very rapidly upon it. Consequently any part liable to be subject to a considerable rise of temperature should not be made of aluminum, nor should it be used for a condenser where soda may be required for cleaning purposes. Aluminum at high temperatures oxidizes with exceptional rapidity. At low temperatures it does not oxidize so rapidly, and the film of oxide on the surface protects the metal from further action.

Professor Carl Myers of Frankfort, N. Y., has begun supplying ocean vessels with balloon outfits. A tank containing the materials for generating hydrogen gas, to inflate the bag, is provided with the necessary fittings and cork. It is believed that the same wind which sends a ship ashore can be made to carry a line to life-savers on the beach.

During the meeting of the American Institute of Electrical Engineers at Niagara Falls this week, the formal starting of the great plant of the Niagara Falls Power Company will occur. At present only one of the 5000 horse power dynamos is in place, ready to supply local customers, but work on two more of them is in progress.

Over 84,330,800 barrels of petroleum were produced in 1894. These figures cover the total production of the world. Of this amount the United States produced 57 per cent and Russia 40 per cent. In 1859 the total production of the United States was only 2000 barrels.

Electric lamps of one-candle power, operated by a storage battery weighing 2½ pounds, and good for ten hours without recharging, are among the latest novelties. The battery is about six inches high and two inches square.

Mining in Old Mexico.

Mining in Mexico is not in a depressed condition because of the low price of silver. This particular industry is prosperous there. The peso or dollar and onza Mexicana is now, and always was, on its equality or standard ratio of $1.21 to one ounce. The peso or onza buys as much there to-day of all the necessaries of life as it always did, and the man in Mexico who works out his silver mine has never felt or known that silver has dropped in value. On the contrary, he has been largely benefited by the drop in silver, as most mines contain in addition gold and other metals which are always paid for according to the gold standard; that is, for his silver he in turn receives his silver in dollars, and there can be no loss while for his gold he receives to-day from $36 to $38 per ounce in silver.

Under the new Mexican law miuing is especially encouraged. The preliminary denouncement of a mine costs from $15 to $25 and requiries publication in the official paper of the capital of the State for ninety consecutive days. At the end, if the party desires a patent, he pays the federal treasury $10 for each pentenencia 325 feet square; hereafter an annual tax is demanded of $10 per pentenencia, and uo further obligation or work is required. Prices vary from responsible positions at $4 per day to $1.25, which, when the capital comes in gold from the outside and is exchanged into Mexican silver, makes it doubly cheap. Hundreds of mines in Mexico are paying handsome dividends, which in the States could not be worked at all under the present silver depression.

The famous Candelaria mine, which has paid its successive owners in the course of 200 years over $150,000,000, is now working on ore which pans only $25 to $28 per ton. The San Dimas district, in which the Candelaria is situated, is said to be the richest in Mexico. Most of the large mines there are iu the hands of Americans. The Candelaria, owned by D. M. Burns and Clarence Matertiame of this city, a group of mines belonging to the Hearst-Haggin Co.; the Coronado property of J. N. E. Wilson, and the Promontores, an old mine recently acquired by F. M. Ochoa and other San Franciscans. All these mines, except the latter, are low grades of free milling gold ores, while the Promoutores hardly goes ten per cent above the others. It is the present advantage of exchange and cheap labor which more than anything else makes those profitable.

Silver-Lead Ore Sampling.

Sealed proposals are invited by the Secretary of the Treasury for the sampling and assaying of lead ores imported into the United States under the provisions of the tariff act. This act imposes a duty of three-fourths of one cent per pound on the lead contained in silver-lead ores, aud under its provisions it is necessary that facilities for sampling and assaying shall be provided, at the expense of the party receiving the contract, at each of the ports at which silver-lead ores are imported. The method of sampling and assaying such ores is to be the same as that usually adopted for commercial purposes by public sampling works in the United States, and the bidder must stand under oath for the facilities under their control for performing the service, and the method in detail which they propose to use. The right is reserved to reject any or all bids, and to award the contract to one bidder for all the work, or to accept separate bids for the general ports at which ores are imported.

Some useful products from what may be termed a novel source are enumerated by the *Revue Scientifique*, as showing the ingenuity and diversification of modern industry, and the value of that bandit of the sea, the shark. Thus the liver of this predatory creature is fouud to contain an oil of a beautiful color, which never becomes turbid, and possesses medicinal qualities of a very valuable character; the skin, after being dried, takes the polish and hardness of mother of pearl, and on being marbled bears a resemblance to fossil coral, so that it is employed by jewelers for the manufacture of fancy objects, by binders for making shagreen, and by cabiuet makers for polishing wood; the fins, independent of use by some as an article of food, are superior for conversion into fish glue, competing in this line with the well-known sturgeon glue prepared in Russia, and are used for clarifying beer, wine and other liquors, also for the preparation of English taffetas, and as reagents in chemistry, etc.; the flesh, too, despite its oily taste, is in some places eaten as food.

The first manufacturing establishment at a distance from Niagara to contract with the power company for electricity from the great cataract is the Plumb, Burdict & Barnard Bolt and Nut Works of North Tonawanda, twelve miles away. This company will use about 200 horse power, applied through sixteen motors.

To be constantly quoted is certainly a sure sign of successful newspaper work. It means that the best judge of a newspaper, the exchange editor, is passing his favorable opinion.—The Fourth Estate.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.

MANUFACTURERS OF

Johnston's Concentrator, Improved Bryan Mills,

Challenge Ore Feeders, Air Compressors,

KNIGHT WATER WHEELS—Highest Efficiency Guaranteed.

MINING, MILLING, PUMPING and HOISTING PLANTS.

FULTON ENGINEERING ++ AND ++ SHIPBUILDING WORKS.

MINING AND MILLING MACHINERY,

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

Office and Branch Works, - - - - - - 213 First Street, San Francisco, Cal.

IMPROVED CRAWFORD MILL.

The Cheapest and Best Mill for extracting gold from comparatively free milling ores. Requires one-third the water, and three-fourths the power of stamps. Costs less, is operated cheaper, and will save 20 to 40 per cent more gold. Average saving 85 per cent. Inexpensive foundation. No plates or screens. Wear and tear guaranteed not to exceed thirty cents per ton. Capacity ten tons. Full particulars,

MECHANICAL GOLD EXTRACTOR COMPANY,

47 BROADWAY, NEW YORK.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MIDDLE BAR BOOMING.—*Dispatch*: J. L. Henry of Montana and six others came to Middle Bar last Sunday to begin work on the mine purchased from Richard Vorlander a week before for $4000—$500 paid down in cash at Wells-Fargo's office in Mokelumne Hill and the $4000 to be paid in six months, by December 1st. They have also bought the rest of the land and ranch, except the orchard and vineyard where Mr. Vorlander lives, for which in one year they pay $3000 more cash down, making $7000 in all. In ten days or two weeks they will have on the ground an engine, pump and complete blacksmith shop, also build a dwelling house, sleeping house, carpenter shop, and stable on the ground and sink a shaft on the west side of Jackass Gulch, just above the tunnel of the Hancock mine, and will prospect the mine thoroughly with this shaft and if it proves rich enough will increase their force, machinery, mill, etc.

The Hancock mine will add another shift of men up in the upper tunnel on the North end of the claim where they first began working some months ago.

BUTTE DISTRICT.—*Republican*: James Morgan, who some years ago spent about $30,000 in trying to prospect the Butte basin has sold that property to a company of Oakland capitalists who propose to prospect the property. They intend to drive a tunnel into the basin from the gulch near the road to Big Bar between 1000 and 1700 feet to drain the basin, so it can be worked. The immense volume of water which is accumulated there has prevented the working of the property in the past and, with a tunnel 1000 feet long, the basin will be tapped about 130 feet from the surface. Additional depth can then be drained by a siphon carried lower down the canyon and the pay dirt can be sluiced out with the water of the tunnel.

Calaveras.

ANGELS MINES.—*From our Travelling Correspondent*: At no time in the past has there been the activity now displayed in prospecting for quartz mines in the vicinity of Angels. The most promising feature is the fact that this work is being done by capitalists or incorporated companies possessed of sufficient capital to carry the work through. The fact that the land is now held by ranchers has not discouraged these investors for instead of buying feet they have bonded whole ranches, thus securing all the veins on the ground at a nominal cost, and the territory in all directions is still large enough to employ millions of capital with every promise of good returns. On the east is the Star of India, then the Turner and Gold Valley, next the Gold Valley No. 2, Blair, Eclipse and Gold Hill. Then follows a wide belt covered by ranches on which the Magog is being opened, on to the east is the Madison, Gold Cliff, Suffolk, next the Johnnie Meyers, then the Utica belt with the Fritz, Bovee, Angels, Lightner, Utica, Stickle and Last Chance; west the Dead Horse and Drake and Tryon, then a stretch of ranches with the Birney on the east. This is all on a direct line from west to east and covers a distance of over three miles. Between these mines are vein after vein crops, and while the work on all of these mines is not sufficient, as yet, to determine their value the mother lode zone at Angels is easily three miles in width. Thus far about all of the work has been confined to a strip about a mile wide across the zone. North and south there stretches mile after mile of country with just enough work done to show that the veins are there and carry gold in paying quantity. As Angels is but 1400 feet above sea level, mining operations can be conducted throughout the year, which fact, coupled with the low rate of miners' wages, cost of supplies and water makes it a very promising field for mining.

The Utica Co.—T. T. Lane, superintendent: As usual the company is "saying nothing and sawing wood." They now have in operation the Utica, Stickle and Madison mills, while operating through the Stickle the adjoining Dead Horse mine. Lately they have bonded the Last Chance, which is the extension of the Stickle to the south, and are putting down a three-compartment shaft, with Walter Tryon in charge.

At the Madison, which is about 3000 feet west, N. Williams, the foreman in charge, has the shaft now down 960 feet. In the shaft the quality of the ore is now not only good but increasing in value in depth. The Utica's mills are in charge of Mr. W. J. Loring, under whom the sixty stamps in the Utica, sixty in the Stickle and forty in the Madison mills pound out a steady stream of the yellow metal. Parallel with the Utica's Last Chance mine is the Drake & Tryon, E. Mattison superintendent. The shaft is now down 100 feet in the foot-wall, and they will now crosscut to the vein.

East of Angels the only mine opened is the Birney, which shows a good-sized body of heavily sulphuretted ore. South, Mr. Jas. Tullock, "Uncle Jim," is opening up the Tullock. He is now down 150 feet, with a sixteen-foot vein. Forty tons of rock worked in the arrastra gave $1640; but Uncle Jim does not have to depend upon his arrastra, as his hand-mortar will give him sufficient gold to keep things running. Uncle Jim claims $700 a ton for his sulphurets and $10,000 in the dump. Parallel with him is the Santa Anna, J. D. McCright superintendent. This mine is just being opened by Col. Shaughnessy, who, in his short shaft, is finding very satisfactory prospects. East, on the Utica vein, the O. K. is being opened by a crosscut by Mr. O. Rollar. On the south are the once famous mines of Carson. The old Morgan, with its great record of $3,000,000 from one cord of rock, sleeps. The old Melones, which joins it on the south, is being experted by L. Janin for Mr. W. C. Ralston. This mine was only mined out on the surface and only the gouge of the vein extracted then. On the Union, Kentucky and Iron Rock nothing is being done. The English company that have been operating south at Robinson Ferry have closed down after trying their two and a half miles on the mother lode in two places.

West—The Carson Creek mine, under M. D. Howell, has its shaft now down 625 feet and is dropping twenty of its forty stamps. To the west of the Utica, the Gold Cliff, under W. Garrard, is dropping its twenty stamps on ore from the open cut, with face eighty feet wide, and mining and milling for 65 cents a ton. Beyond this are ranches, now under bond, on ore of which the superintendent, T. E. Flagg, is opening up the Magog. His shaft shows an iron-stained body of ore, fifty feet wide and heavily sulphuretted. Beyond, to the west, is the Blair, J. J. Schmadake, superintendent, which is running nine and ten-stamp mill on its west vein. Just south is Gold Valley No. 2, with Mr. H. M. Ricketson as superintendent. He is sinking and is now down fifty-five feet, and states that his ore assays up to $26 a ton. West is the Turner, J. H. Roberts, superintendent. The vein has been opened by a crosscut and winze and shows about sixteen feet of good-looking ore. Mr. Roberts is erecting a hoist and preparing to "go down."

Just north and east of the Blair is the El Dorado, W. H. Bisbee, superintendent. The shaft is now down ninety-five feet, with the ore increasing in value. A hoist is now to be put on the property, and his neighbors all agree that "Bisbee has got a mine." North and west is the Eclipse, which adjoins the Blair on the north. Notwithstanding all statements to the contrary, that hard-headed old miner, T. E. Flagg, is superintendent. Their work has been on two veins between the El Dorado vein on the east and the Blair on the west, and on the same vein found in the Gold Hill mine to the west. When Mr. Flagg starts up this fall he has only to crosscut to get about all the veins in that section. West is the Gold Hill mine, S. V. Ryland, superintendent. This is the old "Osborn mine," famous in the past for its pockets. Mr. Ryland has opened up the Hill by drift and open cut, and from the eighty-foot wide ore body he obtained pan after pan of ore from every place that looked barren, and in every instance obtained very good prospects. Going down to the mill the mill man brought out a lot of rock that he had picked out that day, which was 10 to 50 per cent gold.

On a bench lay a slab of rock, saved from the rock breaker, that glistened all over with gold. Mr. Ryland don't claim to have a bonanza, but says "She'll do."

To the north of Angels the Fritz is arranging for a steam plant. The Fritz is just north of the old Bovee, which in early days was held at $5,000,000, and, in the language of one of the miners, "looked like a jewelry shop," and had an offer of $3,000,000 from the Rothschilds. Once this mine is given depth, Angels will have another Stickle. This brings the mines up to Altaville. Just north of Altaville Col. Shaughnessy has bonded the Baumhoffer Ranch, and has three shafts down. The Utica and Dead Horse veins course through this ground and on north through the ranches to San Andreas. West of Altaville, J. G. Divote, of the famous Bonanza mine of Sonora, has bonded the Cherokee, which in the past, yielded about $800,000 from surface pockets.

At Altaville, which is now a part of Angels, is located the Angels Iron Works, Demarest & Fullen proprietors. Mr. Fullen is Mr. Hayward's old master mechanic and is familiar with every detail of mining machinery, while Mr. Demarest is an engineer whose education is up to date. Their shops are full of work, having just completed Fullen ore and water skips with Fullen safeties for Hayward and Lane's Alaska mines, besides supplying their Alaska mills with their white iron dies.

They have built a power plant for the Argonaut mine of Amador county to go 2000 feet; a mill for the Dutch mine of Tuolumne county; sawmill for Hale's mills of Sonora, and are at work on a double reel hoist and air compressor for the Utica Company, and a machine, the first constructed, for the Gottschalk mine, which the inventor claims will cut out a drift the full width and depth as the machine is moved forward on the tracks. The working of this machine will be watched with interest.

Such, in brief, is "the mines of Angels" to day. Investors will not find paying mines for sale at nominal prices, but good territory can be secured in all directions, and in Angels, as elsewhere, on the Mother Lode, it is "go down, or go up." The poor miner is not "in it" in this section. Save to secure a location and show the width and character of the veins in it, the town itself might well be called Utica, as at this time about everything is owned and everyhody in some way is employed hy the Utica Company. The large number of mines now in course of development will soon change this condition, and once the mines are all running full-handed Angels will boom in a manner that will surprise its inhabitants and revolutionize the town and surrounding country.

E. H. SCHAEFFLE.

GENERAL ITEMS.—Calaveras Co. *Herald*: Demarest & Fullen are building some engines for the hoisting works of the Utica Company; also a mill-casting for the Utica Company's plant at Shingle Springs.

The Cherokee, near Altaville, is honded and will soon he in operation. It has a record of hundreds of thousands of dollars taken out, though worked only to a depth of 60 feet. This mine joins the Carley, on which work will commence in a few days. The Cherokee was sold for $75,000.

Humboldt.

THE METTAH MINE.—J. M. Donahue, H. B. Mayo, W. P. Ball and Chas. Hilton of this city are at Metta hon the Klamath river, inspecting the Mettah mine with intention to huy it.

Mr. Donahue will also look at the Klamath Bluff mine, owned by Mr. Perkins of San Francisco. This mine is known to be rich, but a good deal of money will be required to develop it.

Kern.

AMALIE MINING DISTRICT.—The Dull Brothers are taking out sulphite ore from the Mayflower. They have an eight-foot lead.

The Occidental Company have made a strike of sulphite ore in shafts Nos. 3 and 4. The ore has been a chloride hut has increased in richness with depth.

Messrs. Garbett and Stringham, of Los Angeles, are visiting the district.

Mariposa.

Gazette: The California Mines Co. is pushing work at its property, which ineludes the Daisy, Jubilee and Steveson quartz mines, located on the north side of the Merced river, below Benton Mills. A contract has been made with J. J. Brooks to furnish the company with 500,000 feet of lumher. He has erected a sawmill on Dates Flat, eight miles above Coulterville.

The company is arranging to throw a dam across the river some distance ahove the mines, from which point a large flume will be put in. This work will be followed by the erection of a mill of larger capacity.

A NEW MINING DEAL.—J. W. Snyder, C. C. Wallace and S. T. Gage, have bonded the Rollins mine, and men have been put to work. Material for retimbering the mine is being hauled. The mine was worked quite extensively in former years, and is known to be a good one.

Nevada.

THE CADMUS MINE.—*Transcript*: Adolph Weber, W. T. Smith, J. M. Harper and Charles Stepp, are inspecting the company's property on Deer creek below the Home mine. Recently while Supt. Kahl was building a ditch from the Home mine to the Cadmus he cut through a blind ledge a few feet below the surface, two and a half feet wide, the quartz being rich. A tunnel was then run into the hill sixty-five feet, forty feet further down towards the creek. The ledge was cut and the prospects obtained were of such a flattering character that it is the company's intention to sink a perpendicular shaft 300 feet, for the purpose of opening up and developing the ledge. Hoisting and pumping works capable of sinking 1500 feet will be erected without delay. This new ledge has been named the Odea, in honor of one of the stockholders.

THE BOSS MINE.—*Transcript*: H. W. Morris, the principal owner in the Boss mine, near Sweetland, has been over looking at the property and seeing how operations are progressing. He will return to San Francisco and arrange to send up more machinery, so that the capacity of the mill can be increased to twenty stamps. The mine is looking well, there is abundance of ore in sight and with facilities for handling larger quantities of it the property will pay handsomely.

Placer.

RED CEMENT GRAVEL.—*Messenger*: Bacon & Hannish have bonded forty acres adjoining the Baccarat and have extensive works in full operation. They have put up a Cox's pan, and engine and have about thirty men employed, working a day and night shift. Their dirt is of the red cement gravel order, located on the rim rock, hut which dips rapidly, and is fast running into the hlue clay, with increased richness as it dips. The cement vein is about four feet thick, lying on bedrock, which works readily in the pan. They are putting through an average of eighty tons every twenty-four hours, at a cost of about 95 cents a ton. The average yield has been $1.50 a ton, leaving a profit of 55 cents, or about $45 a day, which makes a good fair business.

Plumas.

THE PLUMAS IMPERIAL.—*National Bulletin*: C. D. Hazzard has hought Col. Day's interest in the Plumas Imperial mining property at Hungarian and Emigrant Hill.

Shasta.

GENERAL NOTES.—*Press*: Chas. Lane, of Hayward & Lane, Captain C. Tozier and D. Hunt, are visiting the mines in the vicinity of Trinity Center.

A rich strike was recently made in the Hart mine at Old Diggings, of a two-inch seam in the ledge, about one-half gold.

The Eureka Tellurium Gold Mining Company contemplates the erection of a Huntington mill on the Cleveland mine.

M. A. Delano, superintendent of the Washington mine near French Gulch, has men at work cleaning up the mine and mill.

Haskell & Co., of the Little Maud mine, are arranging for the completion of the lower tunnel and the full development of the mine.

The Eureka Tellurium gold mine started five stamps Monday morning, and are working the ore hy the Murdoff process. The mill will he run to its full capacity.

S. J. Johns, who was elected to succeed W. M. James as superintendent of the Uncle Sam mine, took charge of the property Tuesday. Mr. Johns is the son of Wm. Johns, superintendent for the syndicate of English capitalists who own the mine.

J. H. Beecher came up from Anderson on Wednesday and went out to his mine, on the Igo and Shasta road, to complete the steam arrastra which he recently set up. He was accompanied hy John Beaumont, who brought up a wagon-load of supplies, and an engineer who will superintend the machinery.

R. G. Hart shipped last Saturday, through the Bank of Shasta County to the refiners in San Francisco, a gold brick valued at $1850. This brick represents the result of two weeks' run, but does not represent the output of the mill, as the sulphurets are shipped to the smelters and the returns amount to about $12,000 per month.

Siskiyou.

GENERAL MINING NOTES.—*Journal*: A package containing an even hundred pounds of gold was brought to Yreka last week by W. P. Bennett, lately cleaned up from his mines at Forks of Salmon, estmated to be worth $20,000. A San Francisco company has offered him $100,000 for his claim, half down on delivery and the balance in six months, which offer has been refused.

The hydraulic mines at Oro Fino are now in full hlast, with an ahundance of water to keep piping day and night continually. The prospects seem favorable for the largest yield ever realized at that camp, which contains the finest gold in Siskiyou, and the cause of that camp being named Oro Fino, or fine gold.

Cartwright & Phillips are now running a lower tunnel to strike their lower ledge deeper down at Humbug creek, and feel confident of realizing good pay. In the upper tunnel the ledge ranged from two to four feet thick and showed excellent prospects, this lower tunnel having been made for the purpose of working the claim to better advantage.

The pumping plant at Shasta river for the Espey, Hunter Milling Co. is expected to be ready for operation by the 4th of July, and the pipe up the hill is now being laid with a large force of men at work. As soon as the pump is started the flume will be kept full of water for supplying the giants in sluicing down the banks near Hawkinsville.

H. D. Wright, who has an extensive hydraulic claim at Oro Fino, is taking out a great amount of gold dust at present, keeping his giants steadily at work day and night. The hot sun is melting the snow at a rapid rate, and if the continued hot weather prevails the water supply may run out within a couple of months, as the fountain soon dries when the snow is all gone. He is piping very rich ground at present, with 12 hands employed, and expects a richer yield this season than for many years past.

Shasta.

GENERAL MINING NOTES.—*Searchlight*: The mineral belt about French Gulch attracts attention. C. N. Tozier has succeeded in getting a bond on the New Brunswick mine near the Tower House for $40,000. C. D. Lane and others are interested in the property and development work has begun. "If the vein proves to be continuous in depth and of equal value to surface ores, it will be a large producer," said Mr. Tozier, and "we will expend all the money necessary to prove the property. We will begin at once to run a tunnel which will strike the vein at a depth of 200 feet below the present superficial workings. Our orders are in already for tools and materials, and the work will be pushed to a finish."

The Bell group of mines consisting of the "Black Bear" Golden Eagle and Sunset mines has been bonded to C. A. Hascall. Ore has been shipped to Selby to an extent of five tons and over and the result has been from $300 to $600 per ton. These properties lie on the summit of Muletown mountain.

Sierra.

THE ALASKA MINE.—A sale of this mine in Sierra county was recently reported. But the transaction did not go through. The *Herald* says: It was decided to close down, and on Wednesday a deputy sheriff came over from Downieville with an order of court to seize what amalgam might be cleaned up in the mill, to cover the claim of a merchant who attached the mine. The company owed the men for wages, however, and the superintendent advised the men to resist the officer and appropriate the amalgam themselves, to cover their wages. They did so, and six of them were arrested. They were admitted to hail in the sum of $100 each.

NEVADA.

AT SILVER CITY.—*Enterprise*: Ore is being extracted from the Northern Belle mine in Silver City which is of fair grade, and a dump has been erected to facilitate work.

A run of ahout 100 tons of ore from the Oest mine, worked in the Pollard mill recently, yielded a little over $50 per ton.

ALASKA.

GENERAL MINING NOTES.—*Record*: Lutes & Runkle expect to start their mill up on ore from the Bennett mine this week. They have twenty-four men at work taking out ore.

At the Horrible mine, in the Berners Bay district, owned by F. Bach, a drive of seventy feet shows up a four-foot vein the ore from which assays $16 to the ton. The vein is exposed 1300 feet up the mountain.

F. C. Mayon, superintendent of the Alaska Commercial Co's forty-stamp mill at Unga, keeps the forty stamps running on ore of an excellent grade.

After the sudden death, last fall, of Mr. Hahn, of Hamburg, who organized the Alaska United Gold Mining Company, for the purpose of erecting a two-hundred-stamp mill on the Ready Bullion claim, adjoining the Treadwell mine, Mr. E. De Crano, of Belgium, one of the principal stockholders, took up the work and had arrangements nearly all completed when he, too, suddenly died. His estate is now heing adjusted, and until this is completed nothing will he known of the company's future intentions. Mr. Duncan, superintendent of the A. T. G. M. Co., had reported favorably on the mine, and had it not heen for the death of these two men there would have heen another two-hundred-stamp mill running within sight of Juneau. At the time of Mr. De Crano's death Fraser & Chalmers, of Chicago, were making an estimate on the cost of the machinery.

At Seward City, the Berners Bay Mill and Mining company's twenty stamps are running steadily, and the company will have to send

up more miners preparatory to starting up the forty stamps.

ARIZONA.

GENERAL NOTES.—*Ortiz*: Negotiations are going on for the sale of the Lincoln mine on Lynx creek, Yavapai county. This mine is owned by Prescott men.

Near Ehrenberg work on the Arica mine is going on steadily and as the shafts go down the ore body grows larger. Active development work on this property will be continued.

Thos. Ewing and associates have bonded from Charles Baghy and others a group of gold mines in Hassayampa district, Yavapai county, and will at once begin work and develop the mines in a thorough manner.

Fifty thousand pounds of machinery are now on the ground at the Bull Dog mine, at Goldfields, besides large quantities of lumber. Another carload of lumber is being sent up this week. Work will commence on the twenty stamp mill at once.

In Mohave county Wm. Bohne and Ole Ingelbretsen, who have a contract of running a 50-foot tunnel on the Nighthawk mine, have encountered an eight-inch vein of ruby silver ore after running only fourteen feet. The ore is fabulously rich, running over $18,000 to the ton.

The Ark mine, in Mohave county, is now putting out large quantities of the richest ore ever struck in that property. The drift that was run for the ore chute, found above, is now all in ore. The mill will commence grinding in a few days and shipments of concentrates will again be in order.

THE GILA MONSTER.—Another stamp mill is on the way for the Gila Monster mine, sixteen miles north of Phœnix, Arizona.

THE DESERT MINE.—The Desert mine, fifteen miles west of Harrisburg, recently purchased by Eastern capitalists for $10,000, is being actively operated. The machinery is on the way for a twenty-stamp mill, which will be increased to forty stamps shortly.

THE SHUT-DOWN IN THE FRISCO.—There were about 100 men at work on the Frisco, and 70 of these have been discharged, leaving 30 men, or thereabouts, at work, says the Wallace *Miner*. Of these only 10 men are employed in the mine in addition to a few shovelers. The remainder are working on the surface getting ready for the new hoist and air compressor. All the work at present in progress in the mine is drifting on the lower level and raising from the same. They are grading and otherwise preparing for the large air compressor plant, which has been ordered, but it is not expected here for about two months yet. Manager McDonald states that it is very indefinite when they will resume full operations again.

At Globe, on Tuesday evening of last week a notice was posted at the Old Dominion mine which informed the employees that the mine had shut down until further notice. More than this we are not informed. The pump men have been retained. There is at present no employment for miners at Globe, and the streets are filled with idle men.

COLORADO.

THE C. O. D. MINE SOLD.—The last payment on the C. O. D. mine, at Cripple Creek is made. The property is now owned entirely by the Frenchmen, who have already taken charge. Of the amount paid, $110,000 was due July 1, and $120,000 October 1, but interest at the rate of four per cent per annum was reckoned and discount allowed. H. Leonard will manage the mine. By the sale P. E. Bourke will receive $75,000 and the heirs of J. S. Troy an equal amount. Charles L. Tutt will receive $60,000, and Spencer and Penrose and Capt. Steadman will each receive $50,000.

IDAHO.

MINING COMPANY ORGANIZED. — *World:* Joseph Voshay returned last Sunday from New York and went over to Placerville yesterday. He succeeded in forming a syndicate of wealthy men in New York City to carry on mining operations in this county. The company was capitalized at $1,000,000—500,000 shares at $2 each. Mr. Voshay will be the representative of the company in this country for three years, and will examine mines, secure options with the privilege of developing and report to the company. The Directors of the company are Thurston, Lunsberry and Sims. When options are secured Mr. Thurston will come out and examine the properties. The company will send out money to Mr. Voshay as it is needed for development. The first claims to be developed are Golden Chariot and King Hill, on King Hill, at the head of Ophir creek, near Placerville. Gerard Huppertz has been engaged to take charge of the work.

THE BUNKER HILL AND SULLIVAN.—A Wardner dispatch reports ten additional men put to work in the Bunker Hill and Sullivan. There has been no interference by the miners' union, and the leaders of that organization declare there will be none. They say they rest their case upon the claim that good miners cannot be had for the wages offered by the company, $3 a day, and that under no circumstances will any act of theirs be allowed to precipitate a conflict. Manager Bradley says now that the company has started the work it will go ahead regardless of what action the union may take.

There are new arrivals of men every day seeking work at the Bunker Hill and Sullivan mine. The company is ready to receive all applicants now who want work as miners. Manager Bradley has about completed his working staff. George A. Sonneman has been selected as superintendent, with William J. Twentyman as general foreman. Frederick Burbridge, who has acted as assayer for the company for nearly two years, has been appointed superintendent of the mill. Herring and Williamson are to be shift bosses in the mill. Charles Simmons will soon return from this city to resume his old position as bookkeeper.

THE LAST CHANCE.—It is considered probable that the Last Chance mine will resume. It is stated upon apparently good authority that the injunction placed upon the Last Chance Company in the famous case of the Tyler Mining Company vs. the Last Chance Mining Company will be raised and that the Last Chance people will immediately put on from 80 to 100 men in the mine and 10 or 15 in the mill. The Last Chance, before it got into litigation with the Tyler Company, was one of Wardner's chief supports.

PROSPECTING IN ORO FINO HILLS.—The hills and gulches of the Oro Fino, which yielded quantities of gold in the early '60's, are again being torn up in every direction. Five hundred men, it is estimated, are wandering through the timber, carrying pick, shovel and pan, and each day brings from ten to twenty more. From all over the northwest they are coming, old miner, tenderfoot and every grade between. The boy who was raised on the farm and never slept a week away from under the parental roof, camps side by side with the man who made his stake in Idaho in the '60's or in California in the '50's.

MONTANA.

THE GEORGIA.—A strike has been made in the Georgia mine, near Landusky. The Georgia lies near the Big Chief, and was purchased as a prospect by Spalding last fall for $150. Spalding has refused $15,000 for his interest in the mine. The owners have been engaged in sinking a shaft for several weeks, and at a depth of 27 feet struck a vein which now shows a width of 25 feet. The lead is located in porphyry, and the ore from the bottom of the shaft runs from $25 to $150 in gold.

OREGON.

THE BEEKMAN AND HUFFER MINE.—*Tidings*: J. H. Huffer went to San Francisco on Tuesday to make arrangements for securing a stamp mill to set up at the Beekman & Huffer bonanza on Jackson creek, near Jacksonville. This claim continues to yield handsomely with a hand mortar, a $600 slug being realized last week, and the owners think that, with a three or five stamp mill, they can work some of the less rich ore with profit. The ledge is a wide one of some fourteen feet, with rich pockets.

THE BOHEMIA MINE.—There were sent twenty-five pounds of gold to the Mint here last week from the Bohemia mine, and will return over $5000. This is the largest run for one month yet made, and that with a small mill.

SOLD TO A SALT LAKE MAN.—The Cove and Golden Gate quartz mines in the Sparta district have been sold by George Shindler and O. S. Buckland to F. W. Muhlenbonch of Salt Lake.

SOUTH DAKOTA.

THE LUCKY CUSS.—A Huron, S. D., dispatch says: The Lucky Cuss mine has struck a vein carrying from $10 to $25 of gold per ton, and another vein which carries from $50 to $500 per ton, and is four feet wide.

WASHINGTON.

MINES AND MILLS ABOUT LOOMIS.—The Chopacca Mining and Milling Company have miners at work upon their tunnel and expect to reach the main ledge next week.

Superintendent O. S. Stocker of the Black Bear Mining Company has a force of men doing assessment work on the company's group of five mines, and has started the quartz mill.

The Triune mill recently cleaned up $2,700 in bullion, the result of ten day's run on ore from the Triune mine.

PROBABLY EXAGGERATED.—Geo. Early, foreman and acting superintendent of the Rainier mine, owned by the Negro Creek Nickel and Copper Mining Company, near Leavenworth, makes a report that sounds big. He says the cross-cut tunnel on this property has been driven to a depth of 150 feet, and a double shift is still taking out ore. In all this distance the tunnel shows large veins of ore, the largest one being 37 feet and 6 inches in width. This huge vein has just been passed through and a few feet of gangue matter encountered. This, too, has been removed by dynamite, pick and shovel, and still another vein of ore shows up. Six feet of this has been passed through. Mr. Early thinks he will run fifty feet yet before striking the upper wall, which will make the cross tunnel 200 feet in length. He also expects that the gangue matter will give entirely away as the wall is approached, and that the remainder of the distance will be through solid ore. If this proves to be the case, there will be fully 155 feet of the tunnel running through ore. As the tunnel runs at right angles with the ledge, this would yet leave a ledge of 100 feet of ore. He calculates that a vertical depth of 100 feet has been attained. On the surface the ledge appears to be about sixty feet wide.

J. B. McLaren of Wannacut Lake Mining Company, whose properties are in Golden, has put on a force of men to a 200-foot tunnel on the Standard claim.

THE Edward P. Allis Co., of Milwaukee, Wis., has been awarded the contract of the Carnegie Steel Co., of Pittsburg, for building seven vertical compound duplex condensing blowing engines having 40x60 high pressure, 78x60 low pressure and 76x60 blowing cylinders for their Duquesne steel works.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1906 Stockton St., San Francisco.

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

Scientific Progress.

Some Vestigial Structures in Man.

By W. E. ROTZELL, M. D., Narberth, Pa., in *Hahnemannian Monthly.*

The term vestigial is used in anatomy as being more convenient in describing those parts generally known as rudimentary, aborative, atrophied, or useless. There are many vestigial structures in man, and an attempt to more than mention some of the most interesting of them far exceed the limits of this article.

The appendix vermiformis is a vestigial structure, and, like all such structures, has no function to perform in the organism. "Not only is it useless," says Darwin, "but it is sometimes the cause of death."

The vermiform appendix is, doubtless, the remains of the much elongated caecum that is found in the majority of the herbivorous mammals. The usefulness of the tonsils is also doubtful. They are, as we all know, frequently the seat of disease, and after removal the individual realizes no inconvenience from the loss. Of what utility are the cervical auricles that occasionally occur in man, or the supernumerary legs, fingers, and toes, as well as all the other abnormalitities that frequently occur ?

Among the lower animals there are numerous instances of useless organs, such as the clavicle of the cat, the teeth of a whale, or the sting of a bee or wasp, which when used, as a rule, causes the death of its owner. Referring to insects, Professor Graber says: "There are also numerous structures and organs which may, with absolute certainty, be pointed to as perfectly useless." "But seeing that so enormous a uumber of specific peculiarities are in the same predicament, it surely becomes the reverse of reasonable so to pin our faith to natural selection as to conclude that all these peculiarities must be useful, whether or not we can perceive their utility. For by doing this we are but reasoning in a circle. The only evidence we have of natural selection is furnished by the observed utility of innumerable structures and instincts which, for the most part, are generic, family, or higher order of taxonomic value. Therefore, unless we reason in a circle, it is not competent to argue that the apparently useless structures and instincts of specific value are due to some kind of utility which we are unable to perceive."

The third molars, or wisdom teeth, are becoming vestigial in civilized man. These teeth are now, as a rule, the last to come and the first to disappear; they are smaller and more variable than the other molars and have only two separate fangs.

The body of adult man is always more or less covered with hair; this hair is the remains of the more extensive hairy covering possessed by his ancestors. An interesting fact in relation to this hairy covering is that the hair on the arm and forearm is directed toward the elbow—a characteristic which occurs only in the anthropoid apes and the American monkeys. The explanation of this has been given by Wallace who states that the orang, when resting, holds its long arms upward over its head, so that the rain flows down both the arm and forearm to the long hair which meets at the elbow. In accordance with this principle, the hair is always longer or more dense along the spine, often rising into a crest of hair or bristle on the ridge of the back. In the entire series of the mammalia, from the monotremata to the quadrumana, this character is very prominent.

It is a well known fact in embryology, that at about the sixth month the human fœtus is frequently covered with rather long dark hair over the entire body, except the soles of the feet and the palms of the hands. This covering of hair is shed before birth, and so it is apparently useless except as being an evidence of evolution.

Other vestigial structures are the muscles of the external ear, and the panniculus carnosis, subcutaneous muscles by which a large number of the mammalia are able to freely move their skin, thus protecting themselves from insects. The plica semilunaris, or nictitating membrane, the semitransparent eyelid, is rudimentary in man and other mammals, while in the other members of the vertebrata the function of this structure is to sweep over the external surface of the eye, apparently to keep the surface clear.

The bones of man present such vestigial peculiarities as the supracondyloid foramen, which occasionally occurs; it is normal in the lower quadrumana. There is also the intercondyloid foramen, which occurs in man and the anthropoid apes, but is not constant in either. These peculiarities are found to be more common in the bones of the ancient races of mankind, and also in some savage races.

The anatomy of man presents a large number of vestigial structures, each of which throws some light on the long line of his ancestral history, and that can only be accounted for as explained by evolution.

A New Alloy.

The *Engineer* describes a new alloy, said to justify its right to be called new by possessing qualities not previously found in any of the bronzes. It is called Melloid, and may be described as a malleable bronze. It is a mixture of copper and tin, which is entirely free from zinc, aluminum or iron, and it differs from phosphor bronze, manganese bronze or Bull's metal in being tough and ductile at all temperatures. Many descriptions of brass and bronze can be forged or welded, but Mr. Bull, the inventor, states that with all of them there is a temperature at which they become brittle. This may vary from 400° to 900° Fahr.; and when it is passed, they again become tenacious and malleable if their temperature be raised still higher.

AN ACCOUNT of the sinking of wells in granite and other crystalline rocks, where water is not generally supposed to exist, has been given to the Paris Academy of Science by M. Nordenskiold. Certain pilot and lighthouse stations in Sweden have been troubled by the lack of a suitable water supply. From the fact that water had been found in deep boreholes on rocky islets, Nordenskiold concluded that temperature changes produce shearing stresses between surface rock and that lower down, forming horizontal fissures into which water must percolate from the surface. It was believed that this water would be fresh, as the water reaching from mines extending far under the sea is never saline. Acting on this theory, a well was last year sunk in the island of Arko to a depth of 100 feet below sea level, when a horizontal fissure was encountered, from which was obtained a daily supply of 4400 gallons of perfectly fresh water. Similar wells in other localities yielded water at a depth of 110 to 120 feet. The rock in each case was granite, gneiss or diorite, and the wells—2½ inches in diameter—were bored by diamond drills.

A COMPETITION has recently been opened by the Societe Industrielle de Rouen, France, for an improved pyrometer. The new apparatus is to be portable and capable of indicating temperatures of over 300° C. The prize takes the form of the gold medal of the society, and all competitive material is to reach the president of the society before September 2d, 1895.

THE attempt has been made by Mr. Moisan to produce argon compounds with some of the substances that unite more or less readily with nitrogen. Titanium, boron aud lithium remained unchanged in the new gas under various conditions, as did also uranium and even the intensely active fluorine.

A DETERMINATION by Prof. Barnard with the Lick telescope places the diameter of Neptune at 32,900 miles—from two thousand to four thousand miles less than is stated in most text books.

Mechanical Progress.

Bilge Keels on Big Warships.

A ship's keel has several functions. It gives the hull a backbone, and hence longitudinal stiffness. It also offers resistance to any tendency to slip sideways through the water, this quality depending upon the flat area afforded by either side of the keel. And finally, such a surface must to some extent put a check upon rolling. Although that was not the prime purpose of a keel, the idea occurred to some bright shipbuilder a few years ago that if one kneel would do good in this particular direction, two keels might possibly do more. When the experiment was tried, these were placed one on each side, and as far apart as they could be, and yet remain on what could be considered the vessel's bottom. So gratifying were the results attained that other constructors followed the example; and the idea also found favor among yacht builders. There can be no doubt that such a keel enablcs a sailing vessel to stand up better to the wind with a stiff breeze thau does the old single keel.

But naval experts had misgivings about the utility of the system for great war vessels. Not only were bilge keels bothersome in docking a vessel for cleaning and repairs, but there was much scepticism as to reducing the roll of great heavy ironclads thereby; and it seemed probable that the increased friction might retard a ship's speed. By degrees, however, the idea was extended to cruisers of moderate size. In some cases, four kneels were used, two on a side. The appeudages were 144 feet in length, and not over nine or ten inches in depth; yet they were found efficacious. There was especial hesitation about putting such keels on the great battleships of the Royal Sovereign class, each of which had a tonnage exceeding 14,000. It seemed more than ever doubtful that any appreciable effect would be felt by such enormous craft. Finally, however, two of them, the Repulse and the Revenge, were thus equipped, and tests made in company with the Resolution, a vessel of the same size and qualities. Bilge keels never exteud quite from bow to stern, but taper off before reaching either extremity. John Bull's Director of Naval Construction, Sir William White, told some naval architects in London the other day a little about the result of these tests.

On one occasion, when the Resolution had a roll which sent her twenty-three degrees out of plumb, and the Royal Sovereign and the Princess of India even further, the Repulse never had a greater inclination to the vertical than eleven degrees. At another time, in a storm, when the Resolution swung sixteen or eighteen degrees each way, the Repulse would go only six or eight. In the experiments made with the Revenge in still water, the whole crew set the vessel a-rolling by rushing suddenly from one side of the deck to the other. Before the bilge keels were applied about forty or fifty natural swings were necessary to bring the vessel back to a certain specified degree of repose, after getting her over at an angle of only six degrees; but after the addition of the keels, the swing was extinguished with eight oscillations. Again, by suddenly shifting her barbette guns, the Revenge could be rolled to an angle of thirteen degrees before the keels were applied; and afterward only six or eight, even with 300 or 400 men running across the decks to enhance the effect of the guns.

TO OBVIATE the odor of oil and gas engine exhausts a deodorizing attachment has been brought out in France, a simple device which promises good result. Its principal action depends upon the absorbing proprieties of bone-black, or the affinity which this substance has for certain other substances, among them the objectionable components of the combustion gases from oil engines. The bone-black, is made to exercise a double effect,—acting by absorption as well as in a mechanical way, by filtration. The apparatus consists of a box, divided into two compartments by a perforated partition on which the bone-black is spread in a moderately thick layer. The exhaust gases from the engine enter into the lower compartment at the extreme left, pass through the perforated dividing wall and superimposed layer of absorbent into the upper compartment, and thence escape into the open air through the pipe at the upper right-hand side. The ammonia and fetid hydrocarbon gases are absorbed by the bone-black, and whatever liquid offensive particles may be in the products of combustiou are retained by it mechanically. Water of condensation, which collects the lower compartment, may be drained off through a drip pipe.

The Forge and Furnace of the Future.

The opinion is expressed by a mechanic that the forge and furnace of the future will consist of a lead-lined glass or porcelain vase, or cupola, filled with cold acidified water, to which is connected a strong positive conductor, the forge outfit being rendered complete by a pair of tongs with insulated handles attached to a flexible negative conductor. According to this plan, says the *Scientific Machinist*, the smith seizes the piece of iron which is to be manipulated with the insulated tongs, and plunges it into the sour water, which begins to boil and bubble the instant it comes in contact with the iron, the latter, in a remarkably short space of time, turning to a red and then to a white heat, ready for the work of the smith. So rapidly, indeed, is the heating done by this means that the water and the portion of the iron not immersed in the water are but slightly warmed. The principle involved in this process is of a simple and well known character—resistance producing the light and heat—it being found that enormous heat can be produced by such a method; much greater, in fact, than is necessary to extract iron from the most refractory ores. It is remarked that the value of such a process will be especially exhibited in the more complete and rapid handling of heavy iron and steel plates and bars requiring to be hammered and welded—more valuable still for tempering purposes, as the necessary heat for the immersed portion can be so quickly obtained, while the remaining portion holds comparatively cool.

Comparison of Engine Performance.

From reports of the performances of engines in electric stations the coal consumption per kilowatt hour for various types of engines enable comparisous to be made as to whether the decreased consumption of more expensive machinery will compensate for the increase of investment, while the economy curves of various types of engines running at different loads serve to indicate the size of units to adopt. Small units fall off very rapidly in efficiency with light loads, but large engines of the more highly efficient types may be worked through a great range with little loss—a compound condensing engine represented, for instance, showing an increase of less than a half-pound of water per H. P. hour between the limits of 750 and 2200 H. P., and a 500 H. P. engine of the same type but one pound between 200 and 500 H. P. Another notable point in regard to this efficient type is that the ratio of water consumption between the larger and smaller units is much smaller than with less efficient types. For instance, four units of 500 H. P. each would, if worked near their rated capacity, show an economy corresponding to less than three pounds of water per H. P. hour more than a large engine worked between 500 aud 1800 H. P. In this case, should the load vary from less than 500 H. P. to the maximum, the smaller units directly connected would probably be most efficient through the reduction of losses beyond the engine.

Electrical Progress.

Electrical Fires.

Inspector McDeavitt of Philadelphia has given to a Fire Underwriters' association his ideas on the increasing use of electricity as a fire question, especially in view of the general introduction of the trolley motor, and also the tendency toward complete electrical equipment in modern dwellings. Whenever a fire breaks out the origin of which cannot be traced, the blame is almost invariably put upon electricity. Mr. McDeavitt thinks that more often than not this conjecture is soundly based, and he shows how easily electric fires may be started, and how readily they may by proper care be placed almost beyond the region of possibilities. In most electric fires the primary reason of ignition has been the lack of precaution and unscientific installation. Nothing but skilled labor should be employed in the wiring of buildings, and the use of materials of the highest standard of quality is imperative. It is dangerous to enclose the bulb of an incandescent lamp with any material, even a fabric as light as mosquito netting. The prevalent fashion of shading the light with paper is safe so long as the paper is kept at a sufficient distance from the light; but if it approaches too near, charring takes place and then the heat ordinarily thrown off will cause ignition. Another common cause of fire is carelessness in setting up. The ends of the two wires that lead to a light are composed of of filaments of smaller copper wire, put in contact with the lamp itself by being wound around binding screws and then fastened down. If any of the finer wires escape the notice of the workman and become separated from the main bundle, contact with the metal shell of the socket will cause a "short-circuit," and should the fixture happen to be bound or draped with any decorating fabric, ignition is almost sure to take place. Mr. McDeavitt shows how a fire can be started by a live wire "grounding" with a gas pipe. One pipe in his possession is particularly noteworthy from the fact that it had been eaten through by electric current which had passed along streams of dripping water. About seven inches of the pipe had been pitted through by the action of the intermittent sparking, and the consequence was that the gas had escaped and ignited. Mr. McDeavitt says that the "bugbear" of electric wiring is the pendant cord. The great danger of flexible cords is through their brittleness and rough handling by people who do not know how to treat portable lights. These should always be moved with great care and contact of any frayed ends with the wire that completes the circuit should be avoided.

A Spiral Wall Socket.

Heretofore when brackets or electric fittings have been fixed to brick or plaster walls it has been necessary to drill a hole in the wall with a chisel, plug this with wood and then use the latter as the support for the object intended to be fixed to the wall. A ready avoidance of this troublesome and disfiguring method is now possible. Spirals of metal, in different sizes, are embedded in the wall when the plaster is being applied. When the wall is finished the spiral is firmly held in position and can easily be cleaned out. It then forms a socket in to which a bracket or fitting can be easily screwed and held firmly. This plan saves the walls, carpets and ceilings, and makes the adjustment of any kind of fittings a simple matter.

THE Pittsburg *Times* is authority for the statement that the contract for the electrical equipment of the Manhattan Elevated Railway of New York has been awarded to the Westinghouse Electric Company of Pittsburg. It covers between $6,000,000 and $7,000,000. Manager Hain, of the Manhattan, is quoted as follows: "Electricity is the power of the future in our business, and we must keep up with the times. The contract for that work has been given to the Westinghouse Electric Company. It will involve between six and seven million dollars' worth of electrical apparatus. It will not mean a change in our roadway, but will give us a much cheaper system of operation than that in use at present." Locomotives of 200-horse power will be used and the cars will be heated and lighted by electricity.

Electric Trolley Freight Cars.

A new departure is about to be made by an influential railway company which will be watched with the greatest interest by every railroad corporation in the country. The company proposes not only to install electric passenger cars on many of the "feeders" to its trunk lines, which, at present are run by steam, but to place in regular use a service of electric freight cars especially built for the transportation of grain. The cars are to be lighter than the ordinary freight cars, but much more durable. Each car will carry a set of buckets, by which the loading will be done electrically. It is proposed by means of these cars to make the work of shipping and unshipping much less tedious and expensive than it is at present. The cars can be backed into an elevator switch, and be handled without any trouble or delay. A well-known railroad magnate prophesies that within two years nearly all the grain from the great grain belt of the Northwest will be carried into Minneapolis, its center, by electric trolley

An Electrical Waiter.

There are few people who have not at some time or other looked forward to the advent of the electrical waiter, which, on the pressure of a button, would deliver to the customer sitting at a restaurant table any particular dish that might be specified by suitably arranged signals. The possibilities of electricity are so infinite that it is hard to conceive any application of it that may not sooner or later come into practice. At all events the Utopian idea of an electrical waiter has become a reality. One of the features proposed for the next year's exhibition at Amsterdam, Holland, is an electrical restaurant. The guests are to be served automatically with an elaborate dinner of many courses on pushing a button. A switchboard fashioned in the semblance of a menu card is fixed by the side of each guest, and is connected to the switchboard in the kitchen. Here the order is received. The edibles and drinkables are all placed in little cars, which run on a circular track on the table, and are duly delivered at their appointed destination.

For Telephone Receivers.

A hand attachment has been devised for neutralizing the disagreeable sounds produced in the telephone by induction, and the buzzing and clucking sounds that so commonly interfere with distinctness of hearing. This device is made of pure, soft gum rubber, fitted into a metal rim that springs or clamps over the end of any telephone receiver. This cushion regulates the distance from the diaphragm to the ear drum, and is said to improve the hearing 50 per cent, besides cutting out all extraneous noise. The cushion is large enough to entirely enclose the ear, and thus gives, practically, the advantage of a sound-proof booth.

ELECTRICITY has been rated as a dutiable article by the Canadian Comptroller of Customs. The question arose in connection with importing it into Canada for power and lighting purposes from the plant of the Niagara Falls Hydraulic Power and Manufacturing Co. The Comptroller decides that it comes under the head of unenumerated articles and must pay 20% duty.

AN electric railroad company in Philadelphia took in $11,400 on Memorial day. On Saturday and Sunday after Memorial day the receipts were $10,600 more this year than they were for corresponding days last year.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.
Crocker Building, Rooms 201, 202 and 203, San Francisco.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $5; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.
Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

EDWARD S. COBB,
Mechanical Engineer and Expert.
Tests and Estimates for the improvement of Pumping, Power and Hydraulic Plants.
Will supervise the Construction, Shipment or Erection of Machinery. Will make Drawings, Estimates or Specifications.
Prices obtained for machinery of every description. Twenty year's experience.
109 California St., Rms 30 & 31, S. F., Cal.

GILES OTIS PEARCE,
Mineralogist and Metallurgist.
708 Colorado Avenue, Colorado City, Colo.
Will examine Mines, Ore Bodies, Mineral Belts or Zones, and make written Mineralist Reports, fees for which made known upon application for services. I make my own assays and select my own samples when examing mines. Eighteen years' experience. Analysis of water and soils.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

Almarin B. Paul, M. E.,
Mining Operator,
ROOM 58, CROCKER BUILDING,
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the investment of CAPITAL in RELIABLE Mining Enterprises, also will give attention to the sale of, and reporting on RELIABLE Mining Properties, or the procuring of suitable Machinery for Interest in Developed Mines.

Nevada Metallurgical Works,
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.
C. A. Luckhardt & Co.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

The Secor System of Propulsion.

Notable as is the loss of energy which occurs between the coal-bin and final work-performing appliance in any ordinary steam plant on land, there is even more need of economy in power production on board ships that carry their own means of propulsion. The enormous space occupied by the necessary machinery and store of fuel reduce the capacity for freight and passengers, and constitute a large part of the burdeu to be moved; and the first cost of outfit and the expense of operation impose still other taxes on the commerce for which a steamship is employed. The idea of burning petroleum instead of coal uuder a vessel's boiler, although practiced in only an experimental way thus far, has this great recommendation: Only about half as much fuel, by weight, is required for a given voyage as when coal is used, and hence a larger cargo of remunerative freight may be carried. A much more radical improvement in the same direction is contemplated by John A. Secor, of Brooklyn, N. Y., who has for eleven years beeu experimenting with a system of propulsion peculiarly his own. Preparations for a public test in the near future call fresh atteution to his plan.

Mr. Secor says he can do away entirely with the steam engine and boiler, with screws and shafting, and uses comparatively inexpensive aud compact apparatus. Thus one great source of expense is eliminated and valuable space is gained. His substitute for the old mechanism is a stout, cannon-like cylinder, lying lengthwise in the vessel below the water level, well aft, and opening asteru. From this cylinder he fires at frequent intervals explosive charges of air and gas, mixed in about the proportion of 9 to 1. The gas is manufactured, as in a gasoline or oil engine, only as used, and the material therefor is carried in suitable tanks, that occupy less room than a vessel's coal-bunkers. Ignition may be effected by any of the several means employed with a gas engine; and the products of combustion by kicking against the water shove the boat forward just as a rocket is driven upward by the discharge of powder-generated gases from its lower end. In a vessel 100 feet in length Mr. Secor has experimented with a cylinder measuring 10 feet in length and 18 inches in diameter. In a 25-foot launch he has tried one in which the corresponding dimensions are 3 feet and 5 inches. But in a big ocean liner he says it would be better to have several, perhaps twenty or thirty firing tubes; and he deems it possible to use water gas or producer gas, instead of gasoline or oil. According to his estimate, the material for developing ten-horse power for ten hours could be inclosed in a single cubic foot of space.

Mr. Secor's great claim is that he applies his power so directly as to get a much higher efficiency than is afforded by any other known system. Even with the best steam engines there is a waste. Only part of the energy latent in the fuel gets into the water in the boiler in the form of heat. There is condensation in the steam pipes and cylinder; the exhaust goes out uuder pressure; there is friction at every bearing of every moving part of the engiue and of the shaft, and the screw has more or less "slip" in the water. Froude, long connected with the engineering department of the British naval service, estimated that only 37½ per cent of the indicated horse power of a marine engine got to the propeller. Mr. Secor says he can get rid of all intermediate mechanism between the points where his fuel is consumed and where his power is applied.

One is reminded by this system of the use of water jets for propulsion. Although there is on record an experiment which seems to be an exception to the rule, it has generally been found that water jets do not propel a boat as rapidly as a screw or paddles with the same power. But in such craft there is, in addition to the various other energy-wasting appliances interposed between the fuel and the point where the final work is done, one or more pumps to create the jets; and these alone absorb half of the power delivered to them. The yielding character of the medium into which this stream is ejected permits the explosion to be made with less of a shock than is observed in a gas engine, where the piston's motiou is regulated partly by the flywheel aud "load." That shock, by the way, represents another element of waste. Already Mr. Secor has got rid of vibration, and he hopes to reduce the uoise of explosion—already trifling—to an almost imperceptible minimum. Gas engines have already been much improved in the latter respect; and it is reasonable to expect even less annoyance, in proportion to the charge used, from his firing tube.

This plan, as has been remarked already, resembles that on which a rocket works, except that the discharge is intermittent. Mr. Secor claims that a rocket has the efficiency of 90 per cent and his firing tube about 80. These latter figures he reduces to 56 by allowing for wastes by causes not named. Of course, if anything like this were actually realized in practice he would have unusual efficiency, and it may be that he has overlooked or miscalculated some source of loss. The lateral expansion of his gas, for instance, after emerging into the water, must of course, impair the rearward thrust. In this respect, it may be, a jet of incompressible water might act differently from a volume of elastic gas released from high pressure. However, Mr. Secor is an intelligent, unusually sensible man, well read in the science of thermo-dynamics, and distinctly superior to the "crank" class of inventors; and his methods of iuvestigation and experiment are worth notice.

Weights of Sheet Metal.

It will be interesting, says the *Iron Trade*, to those who have anything to do with sheet iron, boiler plate, or similar material to have an easily remembered rule for finding the weight per square foot of material they are working with. The fact that a square foot of iron plate, one-eighth inch thick, weighs almost exactly five pounds, forms at once a basis for a very simple and easy rule. As a square foot of iron, one-eighth inch thick, weighs five pounds, a square foot of one-fourth inch iron will weigh ten pounds, and we can say that the area of any sheet iron (or iron plate) in square feet, multiplied by the thickness in one-eighths and multiplied by five, will give the weight of the piece. There is a piece of tank iron $\frac{5}{16}$ inch thick, 3 feet wide, and 5 feet loug; how much does it weigh? The area will be 3 feet by 5 feet, or 15 feet square. Now, how mauy eighths is $\frac{5}{16}$ inch? Since $\frac{1}{8}$ inch equals $\frac{2}{16}$ inch, and two is contained in five $2\frac{1}{2}$ times, we say $\frac{5}{16}$ inch equals $2\frac{1}{2}$ eighths, or $2\frac{1}{2}$ times 5 pounds equals $12\frac{1}{2}$ pounds per square foot, and as there are 15 square feet we have 15 feet by $12\frac{1}{2}$ feet equals 187.5 feet. Where the thickness is even eighths of one inch, it is much simpler, but even this is not a hard thing to do as shown. If it is desired to use this rule for other than iron, we simply find the difference between the weights of the two metals per cubic inch and find what a square foot one-eighth inch thick will weigh, then work as shown above.

In a paper on "Face-Hardened Armor," contributed to the proceedings of the United States Naval Institute by Lieut. A. A. Ackerman, it is stated that greater care has to be taken in selecting ingots for harveyized plates than for ordinary oil-tempered plates. The plate, before harveyizing, is forged to nearly the finished dimensions and rough-machined, an allowance being made in its thickness to compensate for the oxidizing of the back in the cementation furnace. Allowances are also made in length, width and the angles of the sides with each other and the faces, it being generally found that all faces become convex. These allowances vary with every thickuess and shape of plate. The strips that are to remain soft for bolt-holes, etc., are then marked off, aud in the furnace are in contact with sand instead of the carburizing material. All the remainder of the face, with the exception of a narrow strip arouud the edge, is then cemented. Plates of small curvature are bent before carburizing, while, where the curvature is greatest, the bending is done after this, but before tempering. In this case, superficial cracks sometimes appear. Whatever the shape of the plate, a bed to correspond is swept in the sand on the floor of the furnace, and upon this is placed a six-inch layer of Harvey's mixture, consistiug of about equal parts of animal and wood charcoal. After placing the plate in the furnace, its sides and back are covered with sand, rammed down, and then by a layer of firebrick, and the temperature raised to from 2230 to 2500° Fahr. When the operation is complete, the plate must be cooled slowly. The plate is then machined and bent to such a shape as will give the desired form after tempering, a powerful spray being forced on the highly heated plate from a number of small, evenly spaced jets.

The Railroad Kidney.

This complaint is uow recoguized by medical men. It is caused by an artificial stoppage of the pores of the skin, the dirt of the railroads being responsible for such stoppage. If any person will examine his hand after riding for two or three hours in a train—and this is especially true if he be perspiring—he will find his hand is dirty. But a closer examiuation will show the existence of a fine grime, the particles of which, so soon as the perspiration ceases, act as minute corks, stopping up the orifices of the pores. How deeply the grime works into the skin is shown by the fact that after a railroad trip oue washes one's hands two or three times before they become clean. It is this grime which produces railroad kidney. Of course it is not to be supposed that an ordinarily healthy person will contract this disease in any trip of a day or two. But where a person is already a sufferer from chronic disease of the kidneys, it is possible that a week on railroad trains would aggravate his malady to an appreciable extent.—Scientific American.

The 69th meeting of the American Institute of Mining Engineers will be held at Atlanta, Ga., beginning October 8, 1895.

Coast Industrial Notes.

—The Port Discovery, Wash., mill and 7,000 acres of lumher land is for sale.

—Nearly 1200 men will he employed at the Mare Island navy yard next month.

—Schaw, Ingram, Batcher & Co., of Sacramento, will shortly install a 26 H. P. engine.

—The Portland, Or., water committee has sold $200,000 thirty-year 5 per cent water honds.

—W. H. Birch & Co. are making two large hydraulic elevators for the Napa Insane Asylum.

—The Nevada City water works propose replacing 2200 feet of their eleven-inch pipe with fifteen-inch.

—The General Construction Company has a contract to huild water works for the town of Santa Clara, to cost $40,000.

—C. H. Evans & Co. are building a steam tug for Central America and complete hoisting works for the Pittshurg Co.

—The Western Manufacturing Co. are turning out some suhstantial machinery for the Usal Lumher Co., Mendocino Co.

—From Stockton southward are surveyed thirty-three miles of the route of the San Francisco and San Joaquin Valley Railway.

—The S. P. Co. is building an $80,000 wagon and railroad hridge across the Sacramento river at Sacramento, to be completed November 1st.

—A daily paper reports the sale of $500,000 6 per cent bonds S. P. R. R. of Arizona at par. Another daily paper asserts that 83 was the selling price.

—W. B. Carr has turned over to Tevis & Haggin all his interest in Kern county, receiving $1,000,000 and 10,000 acres of swamp land in Tulare county therefor.

—In the suit of the United States Government against the Southern Pacific, to ohtain possession of 700,000 acres in Ventura and Los Angeles counties, a decision against the railroad was made last Tuesday by the United States Circuit Court of Appeals, affirming the decision of United States Judge Ross.

—The famous Heidelherg tun, long the largest wine cask in the world, is now exceeded hy one at the Barton winery, at Fresno, which holds 2000 gallons more.

—The San Francisco Marine Firemen's Union reports the loss by death of thirty-one members during the past year. Nineteen members were drowned in the Colima wreck.

—A report prepared by a Poruvian commissioner shows "that, hy the guano contract, the Government has heen defrauded to the extent of more than £180,000. In twenty cargoes it lost 30,000 tons."

—The money is ready in London for the purchase of the Gila Bend or Wolfley, Arizona, canal and dam. A syndicate with a capital stock of £300,000 is organized, and sufficient suhscribed to redeem everything outstanding.

—Lumher freight rates are advancing. Puget Sound quotes: To Shanghai 52s 6d; to Cork 70s; to Sydney, 36s 3d; to Port Pirie, 42s 6d; to Valparaiso, 45s; to Payta, 47s 6d. The average rates to this city are $3.50 and $3.75.

—The sugar-beet crop in the southern part of Alameda county promises well. Two hundred carloads will he produced. The active season hegins ahout the 15th of Septemher. Fifteen cents per hour is paid instead of day's wages.

—L. S. J. Hunt, formerly one of the owners of the Seattle, Wash., *Post-Intelligencer*, hut now in the Orient, has secured from the Shanghai municipal council the right to construct an electric street-car system at a cost of $2,000,000 in gold. The overhead trolley system is to he used.

—All the grain-carrying vessels in San Francisco are chartered. Last year the disengaged tonnage at this time was 71,611 tons. There are now vessels on the way from San Francisco totaling a tonnage of 344,070, and more than half of it has already heen engaged.

—The total acreage of beets planted this season on the Chino ranch is 6720 gross, or ahout 6400 net. The Anaheim crop amounts to about 2700 acres, making in the neighborhood of 9100 acres to be worked in the factory this year. The Chino fields will yield an average of 12 tons per acre this year. If the Anaheim fields do as well, the factory will receive at least 100,000 tons.

—The first car of lumber for the new electric plant near Grass Valley has arrived there—the first of a shipment of sixty-five cars of lumher to be shipped by the Boca Mill Company. The electric plant, when completed, will be prepared to furnish electricity for light and power to run all the machinory of the mines in the neighborhood of Grass Valley and Nevada City.

—A City of Mexico dispatch says a concession has heen granted to a French company, with a capital of 20,000,000 francs, to introduce electric force into that city. The company expects to furnish 20,000-horse power, taken from the waterfalls in the State of Puehla, 125 miles distant. A German electrical concern is also developing plans for supplying electrical energy to the Mexican capital.

—J. Treadwell, R. D. Fry, E. B. Poud, J. D. Brown and B. M. Bradford have incorporated here, capital stock $500,000, of which $30,000 has heen suhscribed, to construct a railroad from a point at or near the coal mines of the San Francisco and San Joaquin Coal Company in Alameda county to a point at or near the city of Stockton in San Joaquin county. The estimated length of the road is thirty miles.

—E. P. Connors has discovered a ledge of soapstone at Centerville, Shasta Co., four feet in width. Soapstone is used largely in the manufacture of paper. The output of this ledge can be placed on the cars in Redding for five dollars per ton. The present market price of soapstone is forty dollars per ton. Mr. Connors is trying to obtain contracts to furnish the paper mills of this State with all the soapstone they require.

—Labor Commissioner Fitzgerald of California has found proof that the majority of the Japs in the State are virtually slaves to the contractors. He will prepare a memorial to Congress asking for strict exclusion of the brownies. He will also open a free-labor hureau in San Francisco in July, amd is confident of finding work for a large numher of men. He likewise thinks that he can locate a good many men on wage-paying placer claims.

—The pilot chart for July of the North Pacific ocean gives a table of ocean distances, in which is shown that the route to Yokohama from the western terminus of the proposed Nicaragua canal is shorter hy way of San Francisco than hy Honolulu. The shortest practical route from Brito, Nicaragua, to Yokohama is 7141 knots; by way of San Francisco it is eighty-nine knots more, while by way of Honolulu the distance is 374 knots more than by San Francisco. The shortest practical route from Brito to Hong Kong is 8740 knots; hy way of San Francisco it is twenty knots farther, while that hy way of Honolulu is 368 knots more than hy San Francisco.

—The Lick trust, organized in 1875, is ended. The Society of California Pioneers and the Academy of Sciences, the residuary specified by James Lick in the original trust deed, will receive $600,000 each. The receipts of the trust have heen ahout $5,000,000 from the sales of real estate, stocks and honds and the collection of rents. Lick's trust doed bequeathed $1,941,000 worth of property for various objects. This property increased in valuation during twenty years nearly 100 per cent. The principal puhlic legacies in Lick's will were: Lick Observatory, on Mount Hamilton, $700,000; School of Mechanical Arts, $540,000; Old Ladies' Home of San Francisco, $100,000; Lick Free Baths, $150,000; monuments at the City Hall and the Park, $160,000.

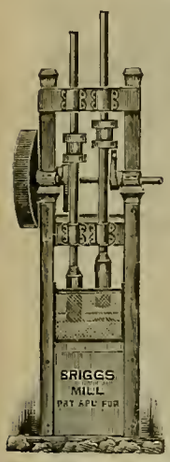
CYANIDE —OF— POTASSIUM,

Ferricyanide of Potassium,
Peroxide of Sodium,
Hyposulphite of Soda,
Sulphide of Iron,

And other Chemicals for Mining Purposes.

The Briggs

TWO-STAMP MILL,



850-lb. stamps; weight of mill, 6000 lbs.

The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.

Complete as per cut, price **$450.00.** This mill is furnished with 9-inch cast steel shoes and dies, and substantial independent iron guides.

Western Manufacturing Company,

114 and 116 Mission St., San Francisco,

Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

HEALD'S

Business College,

24 Post Street, - San Francisco.

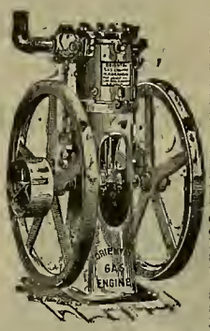
FOR SEVENTY-FIVE DOLLARS,

This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils.

A Department of Electrical Engineering

Has been established under a thoroughly qualified instructor. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

The Oriental Gas Engine



IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

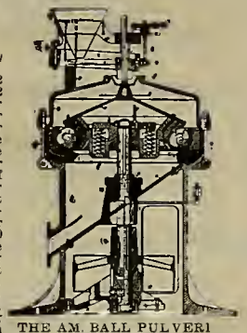
SPECIALTIES:
AM. CRUSHER AND AM. BALL PULVERIZER.
The simplest, cheapest and best machines in the market. Pulverize wet or dry to any degree of fineness. Make little or no slimes in wet nor dust in dry work. Four sizes, capacity from 2 to 60 tons per day.

SEND FOR CATALOGUE. Cable Address, American.

First Prize and Gold Medal Awarded by World's Fair, 1893.

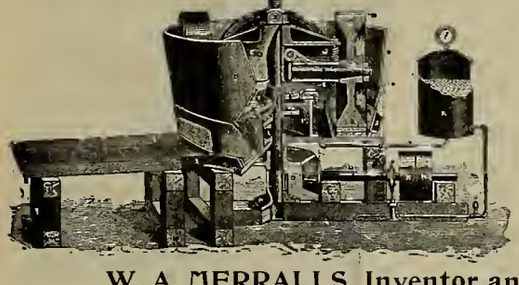
Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O.
Jan. 25, 1894.
The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,
CLEVELAND IRON ORE PAINT CO.



THE AM. BALL PULVERI
Morris Patent.

Merralls' Hydraulic Quartz Mill



Superior to any other Wet Mill now in existence.

A PLAIN, CHEAP, PRACTICAL MACHINE

That will pay for itself in a short time by its very high percentage of gold saving.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Market Reports.

The Markets.

SAN FRANCISCO, June 27, 1895.

Silver has lost a little ground during the week, hut the feehle fiuctuations daily quoted indicate nothing either way.

Officials of the Chinese legation say that the American capitalists who are negotiating in China to secure a loan of 300,000,000 taels, which China is ahout to pay to Japan, are by no means urging a vague or futile suit, and that they stand quite as good a chance of securing the loan as any other money representatives. There is much interesting speculation as to the result of the loan if it is secured hy the American parties. It is said the first result would he the shipment of an unprecedented amount of silver. But as China's bonds are payahle in gold, the ultimate result would be to hring hack gold for the silver paid to Japan. It is pointed out also that the interest on the entire loan will not exceed $5,000,000 annually, so that the Chinese customs receipts of $23,000,000 will readily meet the interest charges and provide a sinking fund for the redemption of the honds, which will probahly run for twenty years.

It is a fact not generally known that naval officers and crews in Chinese and Japanese waters on the Atlantic station receive their pay in Mexican dollars.

"Mexicans" is the term applied to them hy the naval officers. The paymaster of a ship makes a draft on a hanking establishment and receives "Mexicans" for the amount, which he locks in his safe to make his payments. In the Mediterranean French money is used almost exclusively. In South America it is usually American and English gold. In Europe, some years ago, American gold was looked upon with some disfavor, hut English gold was always popular. Now American gold, and even paper money, pass without difficulty. On the Asiatic station the "Mexicans" are purchased hy the paymaster at their bullion value and are paid to the officers and crew at the same rate, usually heing two dollars for every one due the men. The money usually being expended in those countries, the men want the kind that circulates, and "Mexicans" are the favorites, especially with the Chinese.

Officers who do not use their money while on the station generally prefer New York drafts.

Metals generally continue to advance. The copper producers say copper will he quoted at eleven cents before 90 days have elapsed.

J. W. Harrison writes relative to the local coal market:

There is a formidable list of engaged vessels from the colonies, which is continuously added to, until it has grown to be over 150,000 tons capacity. This, of course, has had the anticipated effect of a softening of prices, and of overloading all our principal consumers and wholesale dealers. These liberal shipments would usually have led to a demoralization of prices, hut in the present case very little unsold coal is being forwarded, sales being effected prior to cargoes being ordered. Our present stocks of Australian are very light, and not to exceed 13 cargoes can arrive prior to Septemher 1st, with about 35,000 tons, so our present quotations should maintain themselves in the interum. The last quoted freight rate from Newcastle is 12s per ton, and tonnage (disengaged) by no means plentiful.

The shipments of anthracite coal from Swansea this year will he largely in excess of any former one, and will he utilized for a numher of purposes, supplanting Wallsend. There are ahout 120,000 tons coal capacity already chartered, and the price is fully 25c per ton less than Australian. The yards here are carrying liheral stocks of British Columbia grades.

Mining Share Market.

SAN FRANCISCO, June 27, 1895.

The market opened with more strength and activity this week than has been evinced for considerahle time, and north end stocks were in demand. The Brunswick proposition has put some needed life into the street, in connection with the new deal and revivification of the Comstock Tunnel Co. Franklin Leonard, the president of that Co., who has been on the Comstock for the past week, arrived in San Francisco to-day (Thursday) to confer with mining men on future movements.

It is ahout decided that active work will begin on the Brunswick lode next week.

At the delinquent assessment sale of the Yellow Jacket on Wednesday but 420 shares, mostly halances, were sold for non-payment of assessment, the closest any assessment on that stock has heen paid up in many years. The next assessment falling due is the Hale & Norcross on the 29th. The decision has long been overdue.

The following illustrates the changes of the week:

Assessment Notices.

GOLD BAR CONSOLIDATED MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, La Porte, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of May, 1895, an assessment, No. 1, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of June, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22d day of July, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, Cal.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of June, 1895, an assessment, No. 2, of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the corporation, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 27th day of July, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eleventh day of June, 1895, an assessment (No. 19) of Five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the secretary, at the office of the company, room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the sixteenth day of July, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the sixth day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the twelfth day of June, 1895, an assessment (No. 45) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth day of July, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the seventh day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

R. R. GRAYSON, secretary.

Office—Room 20, No. 331 Pine St., San Francisco, Cal.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

The German Savings and Loan Society,

526 California Street.

For the half year ending June 30, 1895, a dividend has been declared at the rate of four and eight-tenths (4 8-10) per cent per annum on Term Deposits, and four (4) per cent per annum on Ordinary Deposits, free of taxes, payable on and after MONDAY, July 1st, 1895.

GEO. TOURNY, Secretary.

T I. B. HAMMOND CO.

69 First Street, PORTLAND, OR.

MANUFACTURERS OF

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion - Frame, Five - Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The Term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost Is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Send for Catalogue and Price List.
